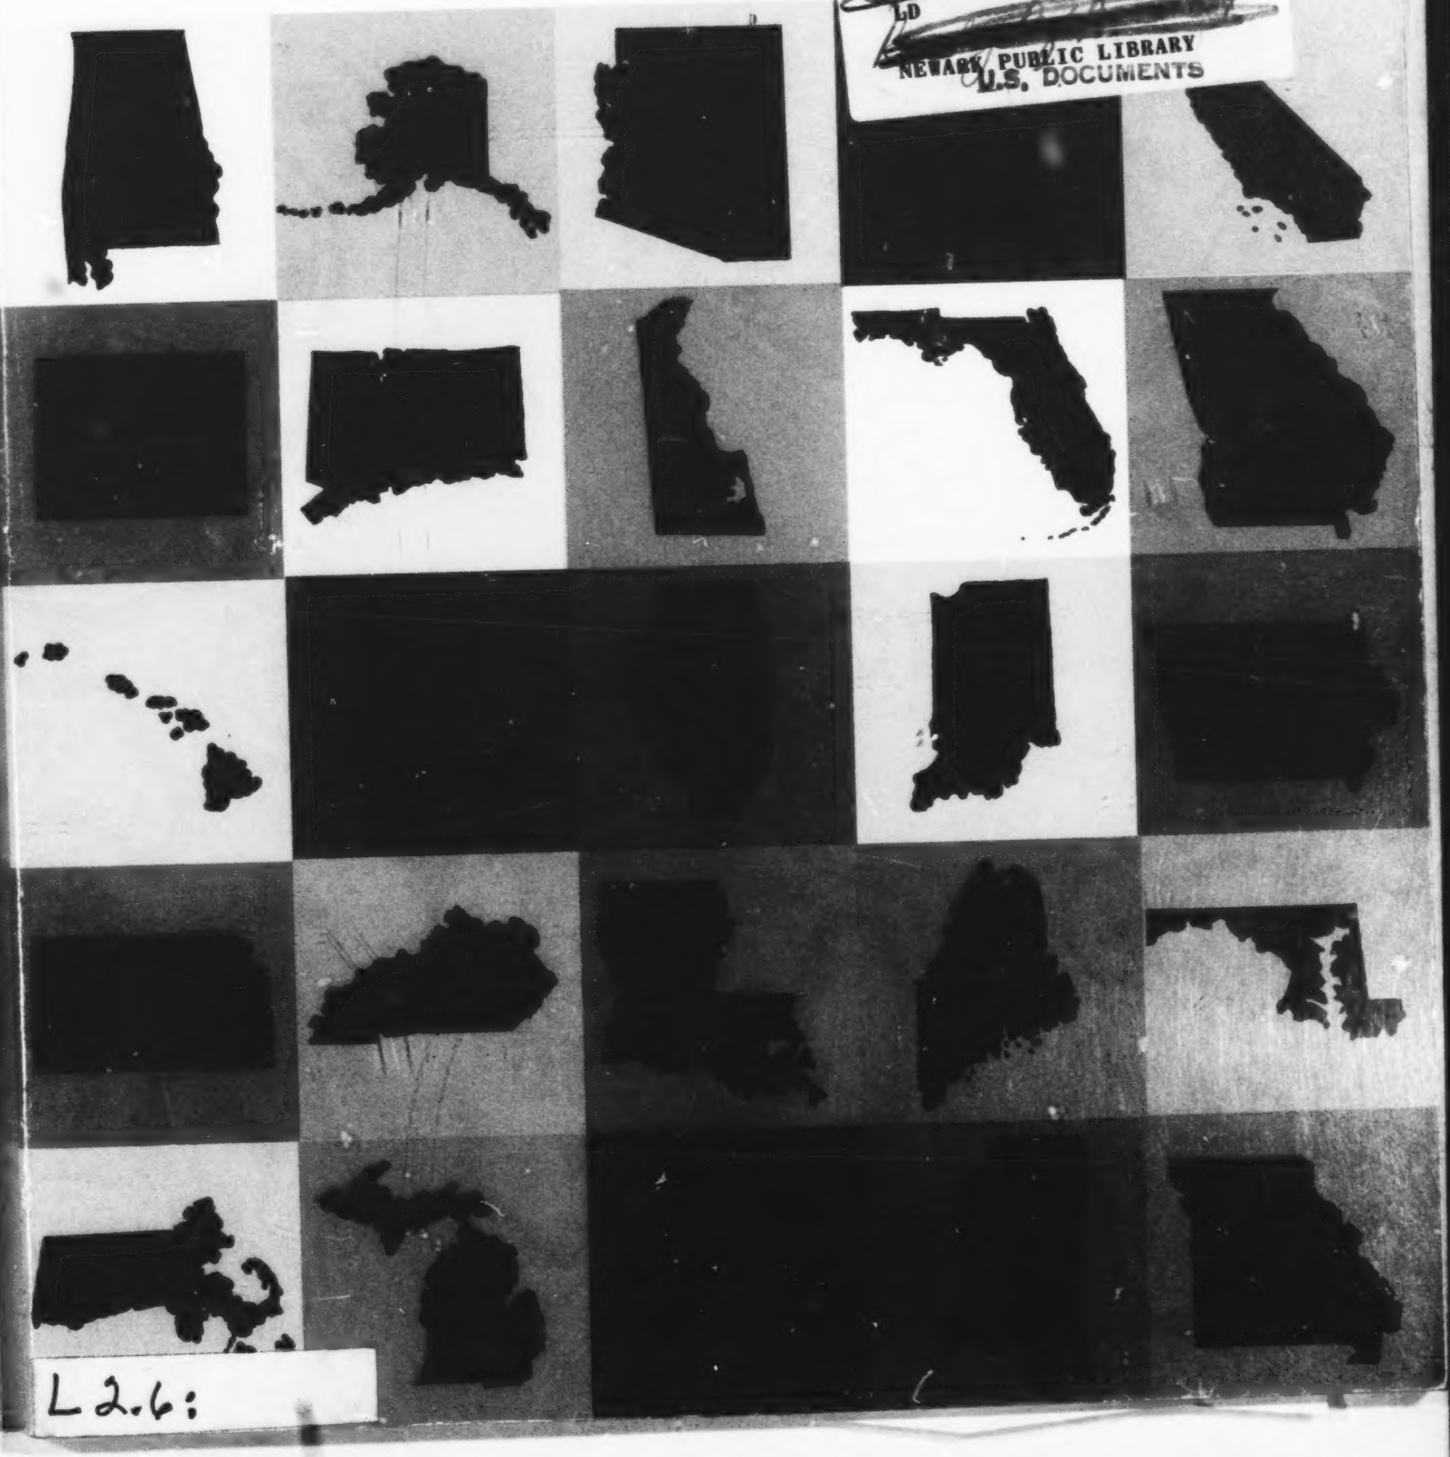
MONTHLY LABOR REVIEW

U.S. Department of Labor
Bureau of Labor Statistics
January 1986

In this issue:
State labor legislation in 1985

NEWARK PUBLIC LIBRARY
U.S. DOCUMENTS



L2.6:

U.S. DEPARTMENT OF LABOR
William E. Brock, *Secretary*

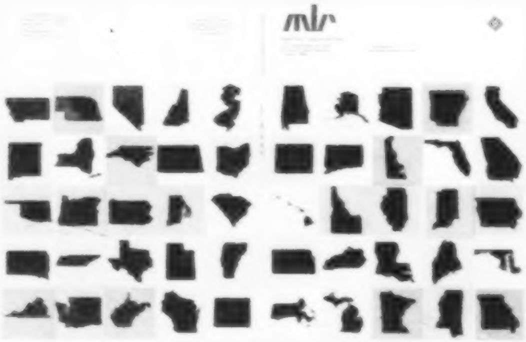
BUREAU OF LABOR STATISTICS
Janet L. Norwood, *Commissioner*

The Monthly Labor Review is published by the Bureau of Labor Statistics of the U.S. Department of Labor. Communications on editorial matters should be addressed to the Editor-in-Chief, Monthly Labor Review, Bureau of Labor Statistics, Washington, D.C. 20212.
Phone: (202) 523-1327.

Subscription price per year—$24 domestic; $30 foreign.
Single copy $4, domestic; $5 foreign.
Subscription prices and distribution policies for the Monthly Labor Review (ISSN 0098-1818) and other Government publications are set by the Government Printing Office, an agency of the U.S. Congress. Send correspondence on circulation and subscription matters (including address changes) to:
Superintendent of Documents,
Government Printing Office,
Washington, D.C. 20402

Make checks payable to Superintendent of Documents.

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through April 30, 1987. Second-class postage paid at Washington, D.C. and at additional mailing addresses.



January cover:

MONTHLY LABOR REVIEW

JANUARY 1986
VOLUME 109, NUMBER 1

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

George Ruben 3 **Labor, firms continue to combat mutual problems in 1985**
Competition, deregulation, and changes in products and consumer tastes confronted bargainers as management demanded two-tier wages and unions tried to save jobs

David J. Schlein and others 16 **Collective bargaining in 1986: cost pressures remain**
The bargaining calendar is heavy in industry but relatively light in State, local government; modest settlements and few strikes mark industrial backgrdund for labor negotiations

Richard R. Nelson 34 **State labor legislation enacted in 1985**
In a heavy legislative year, major laws were enacted in many traditional areas; new laws curb canvassing by children, require screening of day care personnel

Diana Runner 55 **Changes in unemployment insurance legislation during 1985**
Nationally, the phaseout of Federal Supplemental Compensation was legislated; State developments included the creation of shared-work compensation plans

LaVerne C. Tinsley 61 **Key workers' compensation laws enacted by States in 1985**
A number of States made major revisions in benefit provisions and 16 established some form of coverage for police officers, firefighters, and emergency service aides

Labor Month In Review

OCCUPATIONAL ILLNESS. Federal and State labor and health officials met in Albuquerque, NM, December 11 and 12, to explore ways of improving statistics on diseases related to the workplace. The symposium featured speakers with backgrounds in economics, statistics, epidemiology, medicine, public health, law, management, and labor. It was the first symposium of its kind for the Bureau of Labor Statistics, in which the National Center for Health Statistics (NCHS), Occupational Safety and Health Administration (OSHA), and the National Institute for Occupational Safety and Health (NIOSH) also participated. Some excerpts:

Toney Anaya, governor of New Mexico: "Occupational disease and death result in profound human suffering and depletion of economic resources and deserve the same attention given to other causes of death and illness." Anaya pointed to the particularly high risk of exposure which the proliferation of toxic and hazardous substances brought into the workplace after World War II. "Unfortunately, the greatest barrier to preventing occupational exposures is that the cause of illness or death most often is not even recognized, let alone reported."

Janet Norwood, Commissioner of Labor Statistics: "The Bureau's Annual Survey of Occupational Injuries and Illnesses provides comprehensive information on injuries and is useful in evaluating workplace safety, but the data do not adequately measure the health status of workers due to problems of detection, recognition, and causation. To improve measurement of occupational illness and disease, government will need the commitment and cooperation of workers, employers, physicians, insurance companies, and others involved."

Marcus Key, Professor of Epidemiology, University of Texas School of Public Health, outlined the history of occupational medicine, identifying development phases of occupational health in the United States, and describing the interaction of State labor and health departments with the Federal Government in these activities. He proposed that we apply what is already known in this area and begin with appropriate follow-up studies on certain diseases or exposures.

David Wegman, School of Public Health, University of California at Los Angeles, spoke on the recognition and diagnosis of occupational disease. He distinguished between "occupational" and "work-related" disease—the former more readily traceable to specific agents, the latter multifactorial in cause—and noted the importance of predisease medical screening and signs of biological changes for facilitating the recognition and diagnosis of occupational disease.

Edward Baker, Assistant Director of NIOSH, listed some criteria for guiding occupational health surveillance work and research. An important tool is the job-hazard matrix which might be used at the local level to facilitate the identification of occupational hazards and associated health risks.

Joseph DuBois, of OSHA's policy office spoke on three major data sources maintained by OSHA: exposure sampling information required for the regulatory process; compliance data gathered through 400 industrial hygiene inspections over the last 10 years; and data bases and sources maintained by OSHA's Technical Data Center. He urged researchers and analysts to utilize these data.

Manning Feinleib, Director of NCHS, presented an overview of the various surveys and statistical data bases of NCHS. Of particular interest to the symposium were the utility and scope of the National Health Interview Survey, the Health Examination Surveys, and the National Health and Nutrition Examination Surveys. Even more significant, NCHS, in conjunction with the Heart, Lung, and Blood Institute and the Bureau of the Census, is conducting a prospective cohort study of about 1 million persons responding to the Current Population Survey to obtain important information on worker mortality over time.

Proceedings of the symposium will be available later this year. Inquiries should be addressed to: OSHS, Bureau of Labor Statistics, Washington, D.C. 20212; telephone (202) 272-3467. ☐

Changes in Current Labor Statistics

This issue of the *Monthly Labor Review* introduces an expanded and revised Current Labor Statistics section.

Major changes include new tables of comparative labor force, price, wage, and productivity indicators (1-3); export and import price indexes (36-41); international comparisons (45-47); and occupational injury and illness data (48). The section omits some consumer and producer price detail which will continue to be published in the BLS periodicals *CPI Detailed Report* and *Producer Price Indexes.*

Data in the new Current Labor Statistics tables are drawn directly from the Bureau's LABSTAT data base, using two computer languages developed by BLS—Table Producing Language (TPL) and Print Control Language (PCL). The system for extracting the tables was developed by Victor Stotland and Steve Levenson of the Bureau's Office of Technology and Operations Review and Cynthia Mabry of the Office of Publications, with the participation of Gilbert Sturman, Chief of the Division of Production Services. Robert Fisher, Executive Editor of the *Review*, oversaw the project. BLS program offices, which manage the LABSTAT data base, cooperated closely.

Where data were not available for inclusion in the Current Labor Statistics section of this issue, hyphens (-) appear in the data cells. Future issues will include these data.

The editors invite comments and suggestions from users of the Current Labor Statistics section.

Labor and management continue to combat mutual problems in 1985

Competition, deregulation, and changes in products and consumer tastes were among problems facing bargainers; management demanded two-tier wages, lump-sum payments, and alternatives to traditional health plans, while labor focused on preserving jobs and aiding displaced workers

GEORGE RUBEN

Labor-management relations in 1985 were about the same as they have been since 1982. Wage settlements continued to be modest, because of management's pressure for restraint to aid in overcoming competitive problems. Union priorities focused on preserving jobs or aiding displaced workers. Continued moderate increases in consumer prices and employment enhanced the bargaining environment. Major collective bargaining settlements (involving 1,000 workers or more) reached in private industry during the first 9 months of the year provided for wage adjustments averaging 2.9 percent annually over the life of the contract, compared with 3.4 percent the last time the same parties negotiated, generally 2 to 3 years ago.[1]

The competitive problems that have caused the difficulties in some industries in recent years include increasing penetration of U.S. markets by foreign competitors, aided by lower production costs and the "strong dollar" that has hindered domestic firms' ability to sell abroad; intense competition among companies in the deregulated transportation industries; and changes in production and distribution methods, and in customer preferences. All of these foreign and domestic pressures forced employers to extend their cost control measures beyond wage restraint, as they closed marginal facilities, cut employment, and adopted new technology and processes.

At the bargaining table, labor and management continued to adopt "two-tier" compensation systems to limit labor cost increases. Such systems provide for permanent or temporary lowering of wages and/or benefits for new employees while maintaining or increasing compensation for workers already on the payroll. Despite unions' contention that the systems are not good for morale, two tiers are acceptable to current employees when the only other method of aiding an employer would be to cut or freeze compensation for all employees. Unions' concern about morale stems from the fact that employees will be compensated at different levels for the same work and because of the problems that could develop when the lower tier workers in a bargaining situation attain majority control.

In 1985, two-tier systems were adopted in major settlements covering 700,000 workers (already on the payroll), compared with 800,000 workers in 1984.[2] These totals are based on a definition of "two-tier" that includes both temporary and permanent systems. Some analysts would not include temporary systems because new employees do attain parity with current employees after a specified period. Of course, any system, whether temporary or "permanent," is subject to modification or elimination in a future settlement.

Another cost-saving approach that continued in 1985 was the adoption of lump-sum payments in lieu of specified wage increases. Typically, a 3-year contract with such a

---

George Ruben is coeditor of *Current Wage Developments*, a monthly publication of the Bureau of Labor Statistics.

provision might provide for one specified wage increase and two lump-sum payments, or two specified wage increases and one lump-sum payment, at 1 year intervals. One cost savings to employers results because lump-sum payments may not be taken into account in calculating the level of certain benefits such as pensions.

During 1985, major settlements for at least 700,000 workers established lump-sum payments, compared with 800,000 in 1984.

The third approach to holding down cost increases is adoption of contract provisions intended to hold down employer costs for health insurance. Typical measures include offering alternatives to "traditional" plans, requiring second opinions before nonemergency surgery, monitoring hospital stays and procedures, and increasing employee deductibles and co-insurance payments. During 1985, such measures were adopted in major settlements for at least 400,000 workers, compared with at least 500,000 in 1984.

These and other solutions to the problems faced by the employers and unions that bargained in 1985 reflected attempts by the parties to accommodate each other's needs.

Automobiles

Profits at General Motors Corp., Ford Motor Co., and Chrysler Corp. continued at high levels during the first 9 months of the year, but these companies and the other domestic vehicle producers continued to operate under a variety of economic forces that precluded any clear projection of their eventual role in the increasingly internationalized industry. Some important developments in 1985 included continuation of the Japanese producers' voluntary limit on exports to the United States, but at a higher level; some shifting of their sales emphasis from small, low profit vehicles to the larger, higher profit vehicles that had been the province of U.S. producers; expansion of the Japanese presence in the U.S. both in vehicle and parts production; a growing number of joint ventures between domestic and foreign producers, using facilities located here or abroad; and the movement of new nations into the U.S. market. From the viewpoint of the United Auto Workers, the dominant union in domestic automobile manufacturing, some of these events raised the possibility of further erosion of membership, while others offered opportunities for joining U.S. manufacturers in attempts to cut the share of the market held by foreign firms, and organizing their employees in the United States.

Chrysler agreement. The largest settlement in the industry, involving 70,000 workers, was at Chrysler Corp., where the UAW negotiated a return to compensation parity with GM and Ford. However, the new Chrysler agreement will expire in September 1988, a year after the Ford and GM agreements, raising the possibility of future divergences on wages and benefits. From the 1950's until 1979 when Chrysler and the UAW negotiated the first of several concessionary contracts to relieve the company's financial difficulties, the three companies had common contract expiration dates and virtually identical wage and benefit provisions. The company negotiator said the differing expiration was vital because it will enable Chrysler—a considerably smaller company with a narrower product line—to tailor contracts to its own needs.

The Chrysler workers' determination to regain parity was impelled by Chrysler's return to profitability that began in 1983. At that time, the workers negotiated a narrowing of the disparity. In 1984, Chrysler earned a record $2.4 billion profit, followed by $1.42 billion in the first 9 months of 1985.

The 1985 settlement, which ended a 2-week strike, provided for an average 2.25-percent immediate wage increase, an October 1986 lump-sum payment equal to 2.25 percent of each employee's earnings during the preceding 12 months, and a 3-percent pay increase in September 1987. A union official said the 3-percent increase was important because, "it becomes the pattern for the first year" of the contracts to be negotiated at Ford and GM in 1987.

The provision for automatic quarterly cost-of-living pay adjustments was revised to match that at GM and Ford—1 cent an hour for each 0.26-point movement in the BLS Consumer Price Index for Urban Wage Earners and Clerical Workers (1967 = 100), subject to a 24-cent diversion from the allowance over the contract term to help offset benefit cost increases.

In a partial return of the compensation concessions of 1979–82, Chrysler agreed to immediate payments of $2,120 to employees, $1,000 to retirees, and $600 to surviving spouses.

The workers, who had given up a profit-sharing plan in 1983 (before any payouts) in exchange for increases in hourly pay, will receive $500 payments in each of the first 2 years in lieu of profit-sharing distributions. As part of their 1988 bargaining on a new contract, the parties will establish a profit-sharing plan that will assure a first-year payment of at least $500. In a change that was technically not part of the contract, Chrysler agreed to give the employees immediate access to the 183.8 shares of company stock they had been credited with in 1982 in return for their compensation concessions. The shares, valued at $6,900 at the time of the 1985 settlement, previously were available to employees only when they retired or quit their jobs.

Other terms included:

- A lengthening of the pay progression schedule for new employees, matching the changes negotiated at GM and Ford.
- A $187 million Chrysler obligation to a new Job Security Program similar to that at the other companies.
- Further discussions on Chrysler's demand for a reduction in the number of job classifications, which the company contended was vital to increasing productivity.

- Immediate increases in pensions to the GM-Ford level, with a provision that Chrysler workers will also automatically gain any pension improvements scheduled for the first year of the 1987 Ford and GM contracts.

GM's Saturn project. GM announced it would proceed with its Saturn project, a $3.5 billion attempt to eliminate the cost advantages of foreign small car producers. The new, wholly owned production subsidiary, to be located in Spring Hill, TN, will feature state-of-the-art manufacturing methods and a variety of changes in labor-management relations probably never before achieved in one contract.

The initial accord between Saturn and the UAW, which does not have a set expiration date, but can be amended or terminated at any time, provides for:

- Permanent job security for at least 80 percent of the employees, with the other employees subject to layoff only under "catastrophic" conditions to be jointly defined by the company and unions.
- A cooperative work structure comprising work unit members (individuals), work units (integrated groups of about 6 to 15 members), several intermediate joint bodies and, at the top, a joint Strategic Advisory Committee responsible for long-range planning.
- Annual salaries for production workers, rather than the usual payment by the hour. During the period ending 1 year after production of the first for-sale vehicle, annual salaries will be equivalent to $13.45 an hour for operating technicians and $15.49 for skilled technicians. During this period, workers also will receive quarterly payments reflecting compensation changes for UAW-represented workers at other GM plants. Thereafter, annual salaries will be calculated according to an hourly rate equal to 80 percent of the average of five domestic producers. The resulting salaries, which will be subject to periodic adjustment by the Strategic Advisory Committee, will be supplemented by a reward system under which members can earn more or less than comparable GM employees, depending on such factors as the attainment of individual and group production objectives and the profits available for distribution.
- Establishment of a single job classification for production workers and three to five classifications for skilled workers.
- Elimination of time clocks and separate cafeteria and parking facilities for manufacturing and office workers.

GM-Toyota joint venture. In California, New United Motor Manufacturing, Inc., and the UAW negotiated an initial contract for 1,200 workers. New United is a joint venture of GM and Toyota Motor Corp., using Toyota methods to produce vehicles for sale by both corporations. This agreement, like the Saturn agreement, calls for increased cooperation between management and the UAW. One provision cited as "unprecedented" by the union, requires New United to take "affirmative action," including reducing salaries of officers and management employees and returning to the bargaining unit any work that had been contracted out, before laying off UAW-represented employees. Other terms included: wage rates of $13.28 for assemblers and $15.95 for top-rated skilled workers, slightly higher than at GM and Ford; cost-of-living pay adjustment and benefit provisions similar to Ford and GM employees; a 30-minute paid lunch period, unique to the industry; joint committees to resolve problems resulting from employee inability to meet output standards, to implement a comprehensive health care program, and to investigate the circumstances of potential discharges or suspensions of workers; and seniority as the determining factor in transfer and reassignments, if other factors are equal.

American Motors. Unlike the other U.S. producers, Amercian Motors Corp. was still suffering from a sales slowdown in 1985, losing $118.5 million during the first 9 months and holding only 2 percent of the market. Under these conditions, and a company threat to close its Milwaukee and Kenosha, WI, plants, the 8,000 Auto Workers agreed to cut compensation to the level of GM and Ford. In return, American Motors agreed to keep the plants open for the remaining life of its only two car models, the subcompact Encore and Alliance. The company, which is 46 percent owned by the Renault automobile firm of France, indicated that further concessions will be needed if it begins producing the larger cars that have become more popular in the wake of stabilized fuel prices.

The concessions included pay cuts averaging 60 cents an hour, reductions in paid vacations, decreases in the number of company-paid union stewards, and changes in work rules. AMC did agree to a Job Security Program similar to those negotiated at Ford and GM in 1984, and to three lump-sum payments during the 3-year agreement.

Earlier in 1985, AMC and the UAW negotiated a contract for the company's profitable Jeep production plant in Toledo, OH, that was similar to the Ford and GM contracts. (See *Monthly Labor Review*, December 1984, pp. 46–49.)

Mazda to open plant in U.S. In a settlement with Mazda Motor Co., the UAW agreed to compensation levels lower than in the Ford and GM contracts to induce Mazda to locate some production in the United States, rather than continuing to produce all its vehicles in Japan. The new plant, in Flat Rock, MI, is expected to have an advantage of about $6 an hour when it opens in 1987. A union official said the concession was granted "to keep jobs for our people." The plant is expected to produce 240,000 cars a year.

Transportation

In 1985, there were contract settlements in three major transportation industries: trucking and airlines—which shared problems resulting from deregulation—and railroads, which had their own problems, including outmoded equipment and facilities, competition from trucking, and some work rules that originated in the days of steam locomotives.

Airlines. As 1984 closed, so did the Civil Aeronautics Board, which until recently had regulated airline route allocations, fares, and other aspects of the industry. The closing was mandated by the Airline Deregulation Act of 1978, which did provide for the Department of Transportation to continue limited activities, such as negotiating international matters with foreign nations.

As a result of the deregulation, the industry has been going through a period of adjustment, including the entry of new firms, mergers, cutbacks in employment, and some heated collective bargaining over employer calls for concessionary settlements to aid their financial condition.

In collective bargaining settlements during the year—

- United Airlines, the Nation's largest air carrier, and the Air Line Pilots agreed on a 4-year contract, ending a 29-day strike. The contract provided for a two-tier pay system under which new employees would receive 40 percent less than pay levels in the old agreeement. The system will run for 5 years and then be subject to binding arbitration if the parties are unable to agree on its continuance or modification. All pilots will receive a 9.5-percent pay increase over the term.
- American Airlines and the Allied Pilots Association agreed on a pay adjustment to narrow the differential between new and incumbent employees resulting from a two-tier system adopted in 1983. In addition, 4,500 pilots—new and incumbent—received a 4-percent increase to bring them up to the level of American's major competitors. In the settlement, negotiated under a reopening provision, the pilots agreed to work overtime in certain months, if necessary. Previously, the pilots could not fly more than 75 hours in a month, which had forced American to cut flights in two recent months because the pilots had used up their flying time.
- American Airlines and the Transport Workers negotiated a 3½-year agreement that provided for $500 lump-sum payments on September 1, 1985, and March 1, 1986; a $1,000 payment on March 1, 1987; a 5-percent wage increase on March 5, 1988, and a 9-year progression schedule for workers hired during the prior contract (the schedule remained at 12 years for workers hired during the 1985 contract term). The accord covered 12,500 mechanics and other ground service employees.
- Pan American World Airways and the Air Line Pilots agreed on a 32-month contract that provided for wage increases totaling about 25 percent.
- Pan Am and the Transport Workers settled for 6,000 ground-service workers, ending a 27-day strike. Wages were increased about 20 percent, including a 14.5-percent increase scheduled for 1982 that was deferred to aid the company. Employees also received one-time bonuses of $1,000 or $600, the pay progression schedule was stretched to 7 years (from 3 or 4) for new employees, job assignments were broadened, and Pan Am was permitted to hire more part-time employees.
- Pan Am and the Independent Flight Attendants agreed on a 3-year contract that provided for wage increases totaling about 21.5 percent, including a 12-percent pay increase scheduled under prior contracts but deferred to aid the company. The accord, covering 5,700 employees, also established lower pay rates for new employees.

Elsewhere in the industry, the Air Line Pilots' 2-year-old strike against Continental Airlines ended on October 31 by order of a U.S. bankruptcy judge. The order came after 2 weeks of discussions in which representatives of the airline and the union agreed on seniority protection for strikers who return to work at Continental and severance pay for those who do not.

The strike began when Continental, after declaring bankruptcy, resumed operations, cut pay about 40 percent and hired new employees. The Machinists union and the Union of Flight Attendants, Local 1, also participated in the walkout but returned to work under Continental terms in April. A union official said one reason for the return was that "financially our members could not deal with it any longer." The mechanics and related employees received $70 a week strike pay from their union and the flight attendants received nothing from theirs, and the pilots received $2,400 a month.

In September, Continental filed a plan for emerging from bankruptcy protection, after earning $50.3 million in 1984 and $50.4 million in the first half of 1985.

In apparent reaction to its experience in the United Airlines and Continental Airlines strikes, the Air Line Pilots Association announced plans to build a $100 million "war chest" to repel employer attacks on the wages and benefits of its members. The fund, to be used for such purposes as strike benefits to the union's members and loans and grants to other supporting unions, will be accumulated by increasing dues to 2.35 percent of income, from 1.35 percent.

Trucking. The trucking companies and the Teamsters union negotiated under the same conditions as in the 1982 talks: continuing business and job terminations resulting from the influx of thousands of firms into the industry since the 1980 deregulation. Generally, the entering firms are nonunion and have lower operating costs than members of Trucking Management, Inc., and other employer associations that bargain with the Teamsters. The organized industry's problems are illustrated by the fact that Trucking Management, Inc. had 487 member companies in 1979, 286 in 1982, and only 35 in 1985. (Part of the drop resulted from some companies' decision to join other associations or bargain independently with the union.)

The April settlement, ratified by a 62,296 to 54,873 vote, addressed members' concern over the growing number of some companies' decision to join other associations or bargain independently with the union.)

The April settlement, ratified by a 62,296 to 54,873 vote, addressed members' concern over the growing number of unionized firms opening nonunion trucking subsidiaries. The new job security provisions provide that—

- Employers may not divert work performed by Teamsters to any other corporate entity or operation controlled by the employer or the employer's parent company.
- Employers may not farm out dock work except as allowed by past practice.
- When employer business expansions include terminals adjoining theirs, all employees working at the new terminal will automatically be covered by the union's National Master Freight Agreement. If the added terminal is not adjacent, the employees will be covered by the agreement only if a majority sign cards authorizing Teamsters representation.
- Grievances over application of job security provisions will be processed under an accelerated procedure.

In the economic area, the 3-year contract provided for an April wage increase of 50 cent an hour which included 31 cents which would have been payable if the settlement had provided for a cost-of-living adjustment based on the formula in the preceding agreement, which expired on March 31. Similarly, there will be 50-cent wage increases on April 1 of 1986 and 1987 each including 31 cents designated as a cost-of-living adjustment, but not actually contingent on the movement of the Consumer Price Index. (Equivalent increases applied to over-the-road drivers, who are paid on a mileage basis.) Under the 1982 contract, the employees did not receive a specified pay increase, and all but 47 cents of the $1.40 in automatic annual cost-of-living adjustments (based on the movement of the CPI) was diverted to help employers defray the cost of maintaining pension and health and welfare benefits.

New employees are to be paid 70 percent of the top rate for their job and progress to the top rate in three equal annual steps over a 3-year period. Opponents of the settlement called this a two-tier pay system that shortchanged new employees and could have a divisive effect on morale. The union contended that it was not a true two-tier system because the lower pay is not permanent.

The pay rate for all casual employees was reduced to $11 an hour immediately (from $13.21); it will rise to $11.50 on April 1, 1986, and to $12 on April 1, 1987. As before, they will not receive benefits.

Later in the year, 20,000 drivers of automobile-hauling trucks ratified a 3-year contract, ending a 19-day strike. Terms for these drivers also represented by the Teamsters, included $1.80 an hour in specified wage increases; continuation of the provision for automatic annual cost-of-living adjustments, but payable only to the extent that a calculated adjustment exceeds 70 cents; and increased local union control over whether employers should be granted reduced pay rates on "back hauls"—instances in which drivers deliver a load of vehicles to a destination and are able to obtain a load of vehicles for the return trip.

Railroads. Bargaining in the railroad industry seemed to be more drawn-out than usual, as talks that began early in 1984 appeared likely to extend into 1986 for some of the 12 unions. The unhurried pace of negotiations in the industry results from the Railway Labor Act assurance of retroactivity of economic terms to the date specified in bargaining notices served by unions and management. The first settlement in 1985 was between the United Transportation Union and the National Railway Labor Conference for 90,000 operating employees. Based on past practice, relevant provisions of the agreement would serve as a pattern for the other unions.

The agreement, negotiated and ratified in October, resolved a major issue by providing that the 6,000 firemen and 2,000 hostlers (railyard train operators) would be phased out through attrition. This approach followed the recommendations of an emergency board appointed by President Reagan to study the issue. In June, the union and the Conference had negotiated wage and benefit contract changes, and a provision for further bargaining on the firemen-hostlers phaseout issue, subject to binding arbitration if they could not reach agreement. The firemen and hostlers rejected this accord, apparently because of incorrect reports that their jobs would be eliminated by November 1, 1985. As a result, terms for all 90,000 workers were rejected because union procedures require that settlements be approved by all eight operating crafts in the union.

Rail management had been seeking elimination of firemen's jobs for a number of years, contending that they have no useful function. During the days of steam locomotives, which ended about 25 years ago, the firemen shoveled coal into the boiler.

Other terms, which were essentially identical in the rejected and approved agreements, included—

- A six-stage total wage increase of about 10.5 percent (an average of about $1.37 an hour), beginning with a 1-percent increase on November 1, 1985, and ending with a 2.25-percent increase on January 1, 1988.
- A $565 lump-sum payment in lieu of making the initial wage increase retroactive to the July 1, 1984, effective date specified in the contract amendment notices.
- Continuation of the provision for automatic cost-of-living pay adjustments, payable only to the extent that the calculated amounts exceed the specified wage increases effective on the same dates, and also subject to maximum limits.
- An 8-percent increase in the distances crew members must travel during a work shift to qualify for a basic unit of pay, with pay calculations to be based on presettlement

rates, rather than reflecting the 10.5-percent negotiated raise. (Management had pressed for larger increases in qualifying distance, contending that the original requirements set during the days of slower steam locomotives, now resulted in excessive earnings for some employees.)

- A 5-year pay progression schedule for new employees, compared with the previous 1-year schedule.
- Elimination of cabooses on certain types of freight trains.

Elsewhere in the railroad industry, Conrail and the various unions negotiated a 12.5-percent pay increase retroactive to July 1, 1984. This partly restored the earnings the employees gave up in 1981 when they agreed to an immediate 12.5-percent pay cut. Meanwhile, the U.S. Department of Transportation continues efforts to sell its 85 percent share of Conrail. (The remaining 15 percent was distributed to the employees when they agreed to wage concessions.)

Electrical equipment

Preserving jobs was the major issue in negotiations between a coalition of unions and the General Electric Co. and Westinghouse Electric Corp. According to the unions, since the 1982 settlement their membership had dropped to 80,000, from 100,000, at GE and to 34,000, from 41,000, at Westinghouse. Much of the reduction occurred because of the termination of some types of products, such as lamps (at both companies) and consumer appliances (at Westinghouse).

The lead-off GE settlement, which came at the June 30 expiration of the 1982 contracts, contained several provisions intended to preserve jobs and incomes of workers affected by production cutbacks. The contract called for:

- Increasing recall rights to 5 years for workers laid off after 1 year of service (previously, recall rights ranged from 1 year for employees with 1 to 2 years of service to 5 years for those with 5 or more years).
- Extending coverage of the recall program to employees laid off as much as 6 months prior to announcement of a plant closing.
- Extending laid-off workers' transfer rights to any of up to three GE plants within 250 miles of the plant where the layoff occurred.
- Increasing the pay-rate guarantee to 39 weeks, from 26, for workers transferred to lower rated jobs as a result of layoffs.
- Revising the pension plan to extend benefit eligibility to more employees hit by cutbacks and to raise the benefits. ("Normal" pensions also were increased.)
- Instituting an agency shop provision requiring all present and future employees to join the union or pay the union an amount equal to the union dues. This means that an additional 3,000 to 4,000 workers at GE will pay for union services.

Other provisions of the 3-year contracts included an immediate lump-sum payment and a type of two-tier system under which new employees will have to wait 8 months longer to attain the maximum pay rate for their job (the lump-sum payment was equal to 3 percent of the employee's hourly pay rate multiplied by 2,080, the number of hours the workers were expected to be compensated for in the first contract year), 3-percent specified wage increases in the second and third years and revision of the cost-of-living pay formula in the third year to provide for semiannual adjustments calculated at 1 cent an hour for each 0.15-percent rise in the BLS Consumer Price Index for Urban Wage Earners and Clerical workers (the existing formula of 1 cent for each 0.175-percent movement in the index continued during the first 2 years), and improved benefits, such as normal pensions and health insurance modified to provide for precertification of hospital admission, reviews to determine the appropriate length of stay and the level of care, and requirements that patients obtain second opinions prior to certain surgical procedures.

The terms of the settlement at Westinghouse in late July were essentially identical to those at GE.

Farm and construction equipment

Domestic farm and construction equipment producers and their employees continued to experience difficulties during the year, resulting from the growing internationalization of production and sales and world-wide production overcapacity, particularly in view of the continuing slump in the U.S. farm economy. The fact that only International Harvester bargained in 1985 was indicative of the breakup of pattern bargaining in the farm and construction equipment industry, as management and the UAW attempt to deal with the varying difficulties afflicting the companies. Management attempted to cope with difficulties in the industry in several ways:

- Caterpillar Tractor Co., the world's largest producer of construction equipment now facing a growing challenge from Komatsu Ltd. of Japan, continued an austerity program that by yearend was expected to reduce its salaried work force by 20 percent, or 6,200 employees, from the 1982 level and its hourly work force by 34 percent, or 18,000 employees. The company also adopted a new method for determining pension liabilities, resulting in a second quarter expenditure $26 million lower than for the second quarter of 1984.
- Allis-Chalmers Corp., also operating at a loss, closed two plants and sold its remaining farm equipment business to a subsidiary of Klookmen-Humboldt-Deutz AG of West Germany.
- International Harvester Co., the only major farm equipment company to bargain in 1985, settled with the Auto Workers on terms that continued even after the business was sold to Tenneco Inc.'s J.I. Case Co. unit. The 3-year accord restored some of the concessions the workers had accepted in 1982. Under a new Job Content Protection Program featured in the contract, if straight-time hours

worked by UAW members in a product line decline from one 6-month period to the next, the company must reduce overtime hours; cut contracting out of work that had previously been performed by UAW-represented workers; or compensate workers in training and retaining programs at regular straight-time rates.

After Case purchased the Harvester plants, it negotiated changes in contract terms with the UAW to attain uniformity with other Case plants already under UAW contracts.

Rubber

Bargaining between the major rubber companies and the United Rubber Workers was calm and conciliatory, and resulted in wage and benefit gains for the 36,000 workers. A major reason for the ready attainment of settlements was that the companies were operating at a profit, in contrast to the 1982 bargaining round when the industry was in a severe sales slump.

The bargaining on national wage and benefit provisions formally began in March, but there was an important earlier development: In December 1984, Uniroyal, Inc., and the Rubber Workers negotiated a comprehensive cost-containment health care plan to accompany the parties 1985 settlement on wages and other benefits. Costs of the existing health care plans, financed by the companies, reportedly ranged from $2.25 to $2.75 an hour and were rising 8 to 10 percent a year.

Health care cost containment was to be accomplished at Uniroyal by such measures as requiring: "precertification" review for nonemergency hospital confinements; second surgical opinions for certain operations; outpatient x-ray and laboratory tests for nonemergency surgery; and filling of most prescriptions through a mail order drug service.

There were some variations in the cost-containment approaches at the other companies. For example, at Goodyear Tire and Rubber Co., workers can choose either a comprehensive medical plan that includes a savings program or a "medical" necessity program featuring no deductibles or employee co-payments. Goodyear also established a wellness program," featuring periodic health examinations, automobile seat belt usage campaigns, smoking cessation clinics, and stress reduction assistance.

As for wages, the agreements provided for specified increases totaling 43 cents an hour and for continuation of the provision for automatic quarterly cost-of-living adjustments. Benefit changes included a $3.50 increase, to $20, in the pension rate for each year of service.

For the third consecutive bargaining round, B.F. Goodrich Co. settled first on overall terms, followed by Goodyear, Firestone Tire and Rubber Co., and Uniroyal.

At the local level, there were layoffs and plant closings as the companies continued their efforts to increase their 90 percent plant utilization rate. In line with this, employees of Goodrich's Tuscaloosa, AL, plant agreed to a 7-day-a-week operation of the plant. Under such utilization plans, which now apply to 44 of 51 tire plants in the industry, employees' schedules are rearranged so that the plant can be operated on weekends at straight-time pay rates. The change also results in an increase in the number of employees.

The Rubber Workers union was unsuccessful in a National Labor Relations Board representation election at Firestone's only nonunion tire plant, in Wilson, NC. Out of 1,207 employees eligible to participate, 824 voted for "no union" and 311 voted for the union. Managers of the 11-year-old plant did not actively oppose the union because a provision of the Rubber Workers-Firestone master contract requires company neutrality during organizing campaigns.

Textiles, apparel

These related industries continued to suffer from the same problems: increasing imports, leading to cutbacks in domestic production and employment. According to the Department of Commerce, 250,000 domestic textile and apparel jobs have been lost during the 10 years ending in 1984, while the annual value of imported clothing and textiles grew from $3.8 billion to $18 billion.

Noting the condition of the apparel industry, Ladies Garment Workers' President Sol Chaikin described their settlement for 100,000 women's outerwear workers, "as comparatively the best agreement we've signed for many, many contracts." The 3-year agreement, negotiated in May, deferred the initial 6-percent pay increase to June 1986, to be followed by a 5-percent increase in June 1987. The provision for automatic cost-of-living pay reviews (which had not triggered any adjustments during the 3-year term of the 1982 agreement) was continued and employer financing of benefits was increased by 1 percent of payroll. The 1982 contract had provided for a total of $1.10 an hour in specified pay increases, bringing average pay to $6 - $6.50, according to the union.

In the men's and boys' clothing industry, the Clothing and Textile Workers settled for 100,000 shirt, cotton garment and pants workers. The 3-year accord provided for a lump-sum payment of $500 in September 1985, followed by a payment in November 1987 equal to 6.5 percent of individual employee's basic earnings during the preceding 12 months. Other provisions included a 25-cent-an-hour wage increase, an 11th paid holiday, and a requirement that employers give adequate notice of plant closings, or be subject to damage awards set by arbitrators.

Lum-sum payments in lieu of specified pay increases also were a feature of the Clothing and Textile Workers settlement for 56,000 workers in the men's and boys' tailored clothing industry. The 3-year contract with the Clothing Manufacturers Association provided for payments of $500 in December 1985 and $600 a year later. In addition to an 11th paid holiday and increases in pensions, the contract also provided for establishment of a committee of management, union, and community leaders to study competitive conditions, structural changes, and other developments in the industry.

In the southern textile industry, the Clothing and Textile Workers Union had mixed results. The union settled with J. P. Stevens & Co. for the second time since 1980, when the parties ended their long battle over the union's organizing campaign. However, since the 1980 peace treaty, the union has not been able to expand the number of Stevens employees it represents. The Clothing and Textile Workers also suffered a 1985 setback at Cannon Mills Co., where 5,982 employees voted no to union representation, and 3,530 voted yes.

According to the Clothing and Textile Union, its settlement with nine J. P. Stevens plants in Eastern North Carolina did not provide for any increase in the $6.80 hourly average pay because the union was more interested in protecting job security. (Several weeks after the settlement, Stevens sold its bath and bedding operations—about 80 percent of its assets—to Fieldcrest Mills to "reduce the exposure" of the company to cheap imports.) The job security provisions included extended recall rights after layoffs, increased severance pay, improved training programs, and a requirement that the company give more notice of the sale or closing of plants. There also were improvements in medical benefits and paid vacations.

Elsewhere in the industry, the closing of the Nation's largest rayon mill in Front Royal, VA, was averted when 1,500 employees of Avtex Fibers agreed to a reduction in labor costs. The $1-an-hour cut in pay and reductions in paid vacations and possible automatic cost-of-living adjustments makes the plant "very, very competitive," according to the company president. Avtex guaranteed that the decrease in compensation would be repaid to the employees, with interest, even if the plant is closed or sold.

Steel

Despite the generally favorable state of the economy, the steel industry remained in a recession as a result of worldwide overcapacity, leading to widespread price cutting. This led to bankruptcy filings at Wheeling-Pittsburgh Steel Corp. and other companies; plant closings and cutbacks; concessionary settlements by workers at some plants; layoffs and compensation cuts for nonunion employees; and a termination of the industry's coordinated approach to collective bargaining that has prevailed since 1956.

The decision to terminate joint bargaining with the United Steelworkers was made by the five remaining Coordinating Committee Steel companies—U.S. Steel Corp., Bethlehem Steel Corp., LTV Steel Co., Armco Inc., and Inland Steel Corp. When the unified approach was initiated, there were 12 companies in the employer association; but the number dwindled over the years as a result of withdrawals and mergers. J. Bruce Johnston, U.S. Steel vice president and chairman of the association, said the action reflected "the unprecedented change in the American steel marketplace," including inroads by foreign semi-finished steel, and other types, that is often subsidized by governments, joint ventures between domestic and foreign producers, and financial losses by member companies. He maintained that the United Steelworkers abandonment of pattern bargaining had resulted in less costly settlements at some companies that placed the coordinating companies at a cost disadvantage.

Steelworkers' President Lynn Williams declined to discuss the union's future bargaining strategy. He did say that the union would not permit concessions resulting from its continuing negotiations with financially beleaguered Wheeling-Pittsburgh Steel Corp. to serve as a pattern for 1986 settlements with other companies.

A series of events in the crisis at Wheeling-Pittsburgh began when the company initiated unsuccessful labor cost reduction negotiations with the union, declared bankruptcy and then abrogated the existing contract; was then hit by the first major strike in the industry since the 116-day stoppage that began in 1959 and finally negotiated a concessionary contract with union.

When the negotiations began in late 1984, the workers rejected Wheeling-Pittsburgh's offer of shares of company stock in return for canceling the scheduled restoration of wage and benefit cuts negotiated early in 1983. (In a 1982 settlement, the workers had accepted stock in return for cuts in compensation.) Negotiations then continued intermittently, without progress. Finally, in April, the company filed for protection from creditors under Chapter 11 of the Federal Bankruptcy Code, which gives a company the opportunity to reorganize and return to profitability. The bankruptcy filing, which was the largest in the history of the industry, was the first application of 1984 amendments to the Code that were expected to make it more difficult for employers to void labor contracts as part of a recovery plan. In part, the amendments specify that a company may only propose "necessary modifications" to a contract that are "necessary to assure that all creditors, the debtors and other affected parties are treated fairly and equitably." The law also says that the bankruptcy court may allow the employer to abrogate the contract if it finds that the union rejected compensation concessions "without good cause."

A bankruptcy judge authorized Wheeling-Pittsburgh to end the labor contract, explaining, "The court is not unmindful that rejection will entail short-term sacrifices on the part of the employees but, in the long run, they will benefit by a successful reorganization and a stable wage rate."

Immediately afterward, the company informed the Steelworkers that it was reducing the $21.40 an hour wage and benefit level to $17.50. (Reportedly, the industry average ranges from $23 to $24 an hour.) The union responded with a strike that began in late July and continued to mid-October, when the parties settled. Settlement terms included $18 an hour in wages and benefits, including $1.05 for a new supplemental pension plan; a possible pay increase of up to $1 an hour, calculated at 20 cents for each 1-percent rise in the company's steel price; reopening of negotiations if the company emerges from Chapter 11 status; reduced life and medical insurance; and putting two union representatives (one with voting rights) on Wheeling-Pittsburgh's board of directors.

The company's 11 creditor banks, which had been pressing for a $16.65 an hour average compensation level accepted the $18 level after the company agreed to a $12 million limit on severance payments to workers to be terminated as a result of the closing of the blast furnaces and basic oxygen furnace at the Monessen, PA, plant.

At the end of October, Wheeling-Pittsburgh officially terminated its pension plan, which had been costing the company $2.33 an hour for each employee. As a result of the termination, the Federal Pension Benefit Guaranty Corp. will have to assume the plan's $125 million in unfunded liability. If the Federal District Court decides that the takeover should be effective on or after the April 16 bankruptcy filing, the Pension Benefit Guaranty Corp. can, under the law, claim 30 percent of the company's assets. If it is effective on April 15, as Wheeling-Pittsburgh requested, the Pension Benefit Guaranty Corp. would be one of a number of unsecured creditors. At any rate, workers covered by the plan would receive a smaller pension than they would have if the plan had not been terminated. The supplemental pension plan referred to earlier is designed to make up the difference.

Other significant settlements

Aerospace. Although bargaining was light in the aerospace industry, a settlement between General Dynamics Corp.'s Pomona, CA, plant and the Machinists was notable because it eliminated a two-tier pay system. This could influence the results of the general round of bargaining scheduled to begin late in 1986.

Where two-tier systems have been established in aerospace and other industries, unions have accepted them only because they were viewed as less undesirable than a cut in compensation for both current and future employees. Unions generally oppose such systems because of the possibility of friction between employees receiving different rates of compensation for performing the same duties.

The settlement at General Dynamics operations also eliminated a system adopted in 1982 under which all employees (new and current) in lower pay grades received smaller cost-of-living pay adjustments than those in higher pay grades. In addition to holding down the company's labor cost increases, this variation in cost-of-living adjustments was intended to relieve the compression of the percentage pay differential between lower and upper pay grades that had developed over the years as a result of giving all workers the same pay increases.

Shipbuilding. Although a few of the Nation's 92 shipyards had substantial backlogs of Navy work, the overall condition of the industry could only be viewed as bleak as the other yards competed for a decreasing amount of work. Since 1981, when the Federal Government ended its $300 million a year subsidization of commercial shipbuilding, only five large vessels have been completed in the United States. The most successful foreign competitors are Japan and South Korea, which control more than half the world's ship production. Reportedly, these two nations can produce an oceangoing vessel at one-third the cost and in half the time of U.S. yards.

The predictable impact on domestic yards, which has been under way for several years, included shutdowns, several layoffs, bankruptcies, and employer demands for employee compensation concessions to aid in competing for the limited work.

An important contract in 1985 was a concessionary settlement by employees of the Bath Iron Works Corp. that ended a 99-day strike at three shipyards in Maine. Bath said the concessions were vital because it had gone below its labor costs in calculating its winning bid on a naval contract, based on its understanding that the members of the Marine and Shipbuilding Workers would later agree to lower compensation.

The 3-year accord provided for a wage freeze; three lump-sum payments totaling $2,000; $200 payments for each 6 months of perfect attendance; and adoption of a two-tier pay system under which new employees will move to the top rate for their job in three $1 an hour steps over 3 years, instead of a single 50-cent step after 35 working days. Elsewhere in the industry—

- General Dynamics Corp. announced that it will close its 101-year-old Quincy, MA, yard in 1986, with a loss of 4,200 jobs. The company said the action was necessary because it had run out of production contracts. General Dynamics pledged $10 million for aiding the workers, who are represented by the Marine and Shipbuilding Workers.
- On the West coast, concession negotiations involved about 10,000 workers in several States, but there were only a few instances where concessions were actually implemented. At Northwest Marine Iron Works and Dillingham Ship Repair in Portland, OR, a Metal Trades Council accepted 26-percent pay cuts and reductions in night and weekend premiums that will apply only in bidding on specific naval contracts. About 700 workers were involved.
- Tacoma Boatbuilding Co. of Tacoma, WA, filed for protection from creditors under Chapter 11 of the Bankruptcy Code and said its labor costs must be cut at least $3 an hour "to have a realistic opportunity of achieving a successful reorganization." At the time of filing, in September, the company had 800 employees down from 1,850 earlier in the year, including 600 represented by unions.

Dockworkers. The International Longshoremen's Association and the New York Shipping Association negotiated an agreement to improve the competitive position of the Port of New York and New Jersey by reducing the amount shippers must pay into the local union's benefit fund for each ton of containerized cargo handled. The Port Authority had pressed for a reduction after a Federal Maritime Commission administrative law judge found that the local fee was out of line with those in other ILA ports.

Under the revised formula, shippers will pay $5.65 for each ton of cargo moving more than 220 miles to or from the port, or about $160 for each container. The previous rate was $8.90 a ton or about $250 for each container. This reduced the cost advantage of the other ILA ports—which generally base their benefit assessments on hours worked rather than tonnage—by about 50 percent.

Following the reduction decision, the Port Authority released a report indicating that the share of the Nation's cargo handled by the port had declined to 10 percent, from 20 percent 10 years ealier and 50 percent at the end of World War II. The report also showed that there were 32,000 longshore workers employed in the port in 1960, compared with 5,000 active and 3,000 inactive workers currently on the union rolls.

Elsewhere, ILA Local 3000 members in New Oreleans agreed to cuts in crew sizes in an effort to draw more business to the port and counter increasing competition from Teamsters' crews. In another amendment to their contract, Local 3000 waived a $1 an hour wage increase for unloading bulk grain ships that had been scheduled to go into effect in October. The local has about 1,600 members but only about 500 to 600 work daily. A union official said that at its peak, the daily work force averaged more than 5,000.

Parts of the modification agreement were patterned after an earlier settlement for dockworkers in Miami, FL.

Postal Service. Negotiations between the U.S. Postal Service and its four major unions culminated in arbitration awards announced in December 1984 and January 1985. The stalemate leading to the first general use of the arbitration provisions of the Postal Reorganization Act of 1970 resulted from the Postal Service's demand for wage cuts and other cost-savings measures. The quasi-governmental agency had announced that it would unilaterally impose a 20-percent cut in pay rates for new employees beginning in August, but the Congress prevented the action. Still the talks were not fruitful, leading to the arbitration.

In the first award, the arbitration panel concluded that the postal workers' pay had pulled ahead of comparable workers in private industry but said that the discrepancy should be corrected through a policy of "moderate restraint" over a number of years. To begin, the panel awarded a 2.7-percent specified pay increase in each year of the 3-year award. The provision for automatic cost-of-living pay adjustments, which protects the employees earning against 60 percent of any rise in prices, also was continued.

To reduce a compression of the pay rates between workers in the lowest and highest job grades, the panel awarded the percentage wage increases (rather than flat dollar amounts for all workers), and added new higher pay progression steps for the top jobs and new lower starting steps for the lower jobs.

Other terms included a tenth paid holiday, increased uniform and work clothing allowances, and establishment of a joint committee to consider that establishment of a systemwide health care plan for all 600,000 workers covered by the awards.

The four unions are the American Postal Workers' Union; the National Association of Letter Carriers; the Mail Handlers Division of the Laborers International Union; and the Rural Letter Carriers.

Government. In January, 1.4 million Federal white-collar employees received a 3.5-percent pay increase that normally would have been effective in October 1984 but was delayed by President Reagan under authority of the Federal Pay Comparability Act of 1970. The 2 million military personnel also received the equivalent of 3.5 percent increase in January, under laws linking their pay levels to those for the white-collar employees. About 450,000 blue-collar employees also received up to a 3.5-percent increase sometime during the fiscal year ending September 30, 1985. Their pay is raised at various times during the year based on the results of local surveys of wages for similar private industry jobs. However, their potential increase was "capped" at the level for the white-collar employees.

The balance of the year proved to be less auspicious for Federal employees. In a February budget message to the Congress, the President called for a 5-percent cut in pay in January 1986 and a cut in the "expensive, overly generous retirement system." The President's Pay Agent (a triad consisting of the Secretary of Labor, the Director of the Office of Management and Budget, and the Director of the Office of Personnel Management) reported that an 19.1-percent pay increase would be necessary to bring the white-collar employees to pay parity with employees in similar jobs in private industry, based on the annual National Survey of Professional, Administrative, Technical and Clerical Pay conducted by the Bureau of Labor Statistics. However, the President again used his authority under the law to propose a pay freeze rather than a cut. This meant that the next general salary change under the Act could not occur before October 1986.

The President's proposal on retirement benefits were considered by Congress but no major changes had been enacted at this writing.

Wage and benefit increases for State and local government workers were essentially the same in 1984 and 1985. This is apparent from the Bureau of Labor Statistics' Employment Cost Index, which showed that during the third quarter of the calendar year—when most governments begin their fiscal year—State and local government workers pay increased 3.5 percent in 1985, compared with 3.4 percent in 1984. Compensation—pay plus benefits—rose 3.4 percent during the third quarter of 1985, compared with 3.5 percent in the third quarter of 1984.

Supreme Court rulings

The Supreme Court issued decisions in a number of labor cases in 1985, but its February ruling in *Garcia v. San Antonio Metropolitan Transit Authority* had the most widespread implications for employers and employees. In the case, the Court held that provisions of the Federal Fair Labor Standards Act applied to the State and local governments, not just to private employers. The ruling reversed a 1976 decision in which the Court had exempted "traditional" and "integral" State and local government services from minimum wage and overtime pay provisions of the Act.

In mid-November, President Reagan signed an amendment to the Fair Labor Standards Act permitting government units to continue granting compensatory time off, at the rate of $1\frac{1}{2}$ hours for each hour of work in excess of 40 per week. After employees accumulate 240 hours of compensatory time (480 hours for public safety and seasonal workers), the government unit must begin paying them at time and one-half rates for hours worked in excess of 40 per week.

The Court upheld provisions of the shippers and the International Longshoremen's Association labor contract reserving the handling of certain containerized cargo to ILA members. The decision ended 10 years of legal challenges to the container-handling rules, which were adopted in 1974 in an effort to preserve the jobs of ILA members in the face of the rapid movement toward cargo containerization.

Under the contract rules, ILA members have the right to "stuff" or "strip"—load or unload—consolidated container cargoes moving to or from points within 50 miles of a port where the union has jurisdiction, except where the cargo is to be warehoused for a minimum of 30 days.

In other cases, the Court ruled that:

- Unions cannot prevent their members from resigning and returning to work during a strike.
- Before public employees can be fired, they must be informed of the charges against them and be given the opportunity to respond. The ruling was particularly applicable to State and local government workers not represented by unions. Federal employees and union-represented State and local government workers usually already have such protection under legislation or labor contracts.
- Federal employees who are represented by a union in grievance proceedings cannot be afforded more procedural safeguards than nonunion workers.
- States may require employer-sponsored health insurance plans to cover particular ailments.
- Plan trustees have the right to examine the payroll records of companies paying into multiemployer employee benefit funds.
- Federal minimum wage law applies to commercial ventures of religious organizations.
- Employees can be forced to retire before age 70 only if the employer can show that an earlier age is "reasonably necessary to the normal operation of the particular business" and that "all or nearly all employees above [the] age lack the qualifications."

Affirmative action

The major developments in efforts to attain equal employment opportunities regardless of race, sex, or religion was the Equal Employment Opportunity Commission's shift away from the 20-year-old policy of using class action suits, quotas, and goals in attaining equality. Essentially, the Commission's position was that equality of opportunity is a valid and worthy objective, but it should not be attained by using methods amounting to "reverse discrimination."

The policy change was challenged by civil rights groups, which contended that it was a step backward and that, "If race caused it [discrimination], if sex caused it, you must look to race and sex to remedy it."

The first major indication of the policy change occurred in February, when the Commission announced that it would focus on aiding specific people in overcoming discrimination, rather than initiating broad actions against employers or industries. Accordingly, the Department of Justice asked 50 States, counties, and cities to remove numerical goals and quotas from their affirmative action plans.

Following this, the Justice Department took legal action against the City of Indianapolis, IN, to invalidate quotas that had been established to help women, blacks, and Hispanics obtain city jobs. The Department apparently based its case on a 1984 Supreme Court ruling upholding the seniority rights of a group of white firefighters in Memphis, TN, facing dismissal under an affirmative action plan.

Comparable worth. In another aspect of equal employment opportunity, the Administration moved away from supporting the concept of "comparable worth." In general, backers of the concept, also described as "pay equity," contend that the accepted principle of equal pay for the same job should be extended to provide equal pay for different jobs that require equivalent training, skill, judgment, and other factors that make them of comparable worth to the employer. In practice, this would generally result in pay increases for women in "traditional" women's jobs, such as secretaries, nurses, and librarians. Despite the Administration's position and an appeals court ruling overturning a 1983 decision in a Washington State case that had triggered much of the pressure for widespread adoption of the approach, about 25 States had initiated studies of pay relationships among their employees and several others had implemented plans to eliminate disparities. Several cities also legislated or negotiated such plans. To date, the concept had been essentially limited to government workers, but a few private employees, including American Telephone & Telegraph Co., are studying their pay structures.

In the Washington State ruling, a three-judge panel of the 9th U.S. Circuit Court of Appeals reversed a district court judge's order that the State immediately raise the salaries of 15,000 of its women employees to implement an earlier finding of pay discrimination. (See *Monthly Labor Review*, February 1984, p. 66.) In its ruling, which is being appealed by the State, County, and Municipal Employees union, the appeals court said, "The state did not create the market disparity and has not been shown to have been motivated by impermissible sex-based considerations in setting salaries."

Despite the ruling, the union and the State were continuing negotiation on how to allocate $41.6 million the legislature had provided to eliminate the pay disparity.

One indication of the Federal Government's opposition to the comparable worth concept occurred in June, when the Equal Employment Opportunity Commission said it would not act on behalf of women who allege discrimination in pay under the concept. The decision came in a case in which an Illinois housing authority had been charged with paying its mostly female administrative staff less than its mostly male maintenance staff, despite claims that the skill, effort, and responsibility were comparable.

However, the Commission did say that it would act in cases where it can be shown that employers intentionally pay women and men different amounts for comparable work.

In April, the U.S. Commission on Civil Rights also rejected the comparable worth concept. The Civil Rights Commission conceded that a wage gap exists between men and women but claimed that "gap is not entirely due to discrimination, so it is wrong to eradicate it in the name of anti-discrimination."

One of the negotiated pay equity plans was in Los Angeles, CA. It was part of a new 3-year collective bargaining agreement providing for wage and benefit improvements for 30,000 city employees. Of that number, about 3,900, most of them women, will receive an additional 10- to 15-percent pay increase, in steps, over the term. The adjustments, costing $12 million, apply to clerks and librarians.

In Minnesota, the State Legislature appropriated $11.8 million to complete pay equity adjustments to State employees, following a $21.8 million appropriation in 1983 to start the process. Meanwhile, the State's local governments were proceeding under a 1984 State law requiring them to complete pay equity studies of their employees by October 1985 and make any corrective pay adjustments by 1987.

AFL-CIO rejuvenation program

The year 1985 marked the 50th anniversary of the merger of the American Federation of Labor and the Congress of Industrial Organizations, an undertaking to improve the economic and social condition of workers by giving them more influence in the Nation's affairs. Over the years, the level of acceptance and influence of unions has varied with changes in economic, social, and political conditions. The past few years clearly have been a period of decline, conceded by the Federation when it said "unions find themselves behind the pace of change." This finding, and proposals for reversing the decline, were contained in a report, "The Changing Situation of Workers and Their Unions," concluding a 2-year study by the AFL-CIO Committee on the Evolution of Work.

On an optimistic note, the Committee said that current "prophesies of doom and despair" were similar to those in the 1920's and 1930's, when unions were in decline but regained strength by altering strategies.

The Committee recommended a number of changes in strategy to reverse the decline in membership and influence:

- New methods of advancing the interests of workers by adopting new bargaining approaches seeking out and addressing issues of concern to workers; establishing new categories of membership for workers not in an organized bargaining unit; expanding use of electronic media; undertaking comprehensive "corporate campaigns" to increase pressure on anti-union employers; and re-examining the use of the organizing committees used in past campaigns.
- Increasing members' involvement in their unions by increasing opportunities for them to participate in union affairs; increasing interaction between members and national union leaders; orienting new union members; and increasing the training of union officials and members.
- Improving the labor movement's communications by better publicizing its accomplishments; training union spokespersons in media techniques; informing news reporters about unions on a continuing basis; determining the value of advertising in improving the public's understanding of unions' and informing the public of violation of workers rights to form unions.
- Improving organizing activity by carefully selecting and training organizers; making greater use of modern technology; increasing union leaders' and members' involvement in organizing efforts; selecting organizing targets with greater care to increase the changes of success; devoting more efforts to small units of workers; experimenting with new organizing techniques, such as focusing on a major issue; assisting workers in new bargaining units in negotiating initial contracts; and attempting to enroll employees who are represented by a union but are not union members.
- Structural changes to enhance the labor movement's overall effectiveness by setting guidelines and encouraging mergers; providing AFL-CIO staff aid in completing mergers; establishing mechanisms for resolving organizing disputes among unions; utilizing advanced business methods in increasing internal union efficiency; and increasing unions' financing and support of State-level multiunion organizations.

The AFL-CIO has begun to implement the Committee's recommendations. One program "One on One," is designed to increase union vitality by having local union officials discuss labor issues with individuals or small groups of members. Another program is intended to improve unions effectiveness in dealing with the media by training 1,000 volunteers as union spokespersons.

The Federation is also preparing a package of benefits such as life insurance, legal insurance, and low-cost credit cards to be used by individual unions in inducing workers to become "associate members." This recruitment will be limited to individual workers not covered by collective bargaining agreements.

Internal union affairs

During the year, there were a number of merger developments, some of which began before the AFL-CIO committee's call for merger and increased organizing efforts to strengthen the labor movement:

- Leaders of the International Typographical Union were moving toward merging with the Graphic Communications International Union as part of an effort to attain "One Big Union" in the printing industry.
- The Upholsterers International Union became the Upholstery and Allied Industries division of the Steelworkers union.
- The Auto Workers union lost about 10 percent of its membership as its 120,000 Canadian members established a separate union. The split, described as amicable by both sides, can be traced to the changing economic relationship between the two nations and the resulting differences in collective bargaining goals. The allocation of strike funds and assets between the two unions was approved in 1985, but the separation is still subject to approval at the UAW's international convention in 1986.

Organizing, the other way to increase union size and strength, drew increased attention in 1985. One area of attention was the State of Ohio, where a number of unions vied for the right to represent 14 units of State government employees. An estimated 200,000 State and local government workers gained the right to bargain collectively under a 1983 law.

In the private economy, the Service Employees and the Food and Commercial Workers were in the midst of a drive to organize the 87,000 employees of the Beverly Enterprises nursing home chain. At midyear, the unions reported that they had gained the right to represent 9,000 workers and had negotiated about 80 contracts.

In terms of size, the biggest organizing challenge faced the Communications Workers, which announced that it, in concert with a few other unions, was planning a "long term" worldwide effort to organize the 340,000 employees of the International Business Machines Corp. First, the union will attempt to organize one of IBM's major competitors, Northern Telecom Inc., and other high technology firms.

Leadership changes in the labor movement in 1985 included

- Kenneth J. Brown retired as head of the Graphic Communications Union and Recording/Financial Secretary James J. Norton became acting president until a January 1986 election.
- J. C. Turner retired as president of the Operating Engineers and vice president Larry L. Dugan, Jr,. was selected to succeed him. Dugan's term will run through January 1, 1989.
- William G. Lindner, president of the Transport Workers, died and was succeeded by executive vice president John D. Lawe.
- Communications Workers President Glenn E. Watts retired and Morton Bahr, a union vice president from New York, was elected to succeed him.
- Jesse M. Calhoun retired as president of the Marine Engineers and the union's executive board elected C. E. De Fries to succeed him. De Fries had headed the union's Pacific Coast District.
- Lawrence A. Holley retired as president of the Aluminum, Brick and Glass Workers and vice president Ernie La Baff was elected to succeed him.
- Boris Block retired as secretary-treasurer of the United Electrical Workers union and Amy R. Newell, a staff organizer and contract negotiator, was elected to succeed him. □

FOOTNOTES

[1] Preliminary statistical information for all of 1985 is scheduled to be released on January 27, 1986. Both the first 9 months and full-year figures exclude possible pay adjustments under cost-of-living formulas because such adjustments are contingent on the future movement of a consumer price index.

[2] This article is essentially based on information available early in December for bargaining units of 1,000 workers or more.

Collective bargaining during 1986: pressures to curb costs remain

With contracts expiring in steel, construction, and telecommunications, the bargaining calendar in private industry is heavy but relatively light in State and local government; contract talks in industry will be held against a background marked by modest settlements and few strikes

DAVID J. SCHLEIN, PHYLLIS I. BROWN,
AND FEHMIDA SLEEMI

Contracts for about 3.8 million of the 9.1 million workers under major collective bargaining agreements (covering 1,000 workers or more) in private industry and State and local governments will expire or be reopened in 1986. The bargaining calendar in private industry is heavy; contracts for more than two-fifths of the 7.0 million workers under major agreements are up for negotiation. In State and local government, however, the calendar is relatively light: one-third of the 2.1 million workers under major agreements have contracts scheduled for renegotiation. In 1985, by comparison, one-third of private industry employees and more than half of the State and local government workers under major agreements were involved in contract talks.

Information on 1986 bargaining is based on data available to the Bureau of Labor Statistics on September 30, 1985. The proportion of workers under contracts that expire or reopen in 1986 would increase if settlements reached during the fourth quarter of 1985 result in contracts that expire during 1986. In State and local government, for example, 374,000 workers are under contracts that expire before the end of 1985 and for which settlements had not been reached as of September 30. In the event that all these contracts are settled during the fourth quarter and call for termination or reopening during 1986, bargaining activity for the year in State and local government would be heavy, involving about one-half the workers under major agreements.

Management and labor representatives, who will negotiate as 661 private industry and 238 State and local government major agreements expire or reopen this year, will face some issues that are common and some that are unique to their industry or individual bargaining unit. (See tables 1 and 2.)

Economy continues strong

During 1985, the national economy remained basically healthy. Some areas improved; others caused concern among economic observers. On the bright side:

- The unemployment rate in September 1985 was 7.1 percent, compared with 7.5 percent a year earlier.
- The Consumer Price Index for all Urban Consumers (CPI-U) increased 3.2 percent during the 12 months ending September 1985—the slowest price rise since 1967.
- The composite index of leading economic indicators, compiled by the U.S. Department of Commerce to forecast movement in aggregate economic activity, suggests continuing but slow growth into 1986.

Worrisome aspects of the economy include a national debt nearing $2 trillion, a trade deficit running at an annual rate of $125 billion as of mid-1985, and a strong dollar that makes it harder to sell American products abroad and easier to sell imported goods here. Indeed, many of the industries that will be bargaining this year—especially aluminum, farm machinery, steel, and copper mining—have been suffering from foreign competition. Domestic competition—from nonunion firms—will be of concern to bargainers in

---

David J. Schlein and Fehmida Sleemi are economists and Phyllis I. Brown is a social science research analyst in the Office of Wages and Industrial Relations, Bureau of Labor Statistics.

January-June	225	1,345	…
July-December	41	264	…
Total 1989 and later	18	59	…
Year unknown or in negotiation[6]	330	1,329	…

[1] Includes all private nonagricultural industries and State and local governments.

[2] Totals are less than the sum of the parts because 65 agreements covering 258,000 workers have both reopenings and expirations in the reference period. Includes 576 State and local government agreements covering 2,140,000 workers.

[3] Includes [illegible] agreements covering [illegible] workers which have wage reopenings scheduled in 1986. Includes 250 State and local government agreements covering 737,000 workers.

[4] Includes 14 agreements covering 38,000 workers which have wage reopenings scheduled in 1987. Includes 177 State and local government agreements covering 744,000 workers.

[5] Includes 3 agreements covering 12,000 workers which have wage reopenings scheduled in 1988. Includes 74 State and local government agreements covering [illegible] workers.

[6] Includes agreements which were due to expire between Oct. 1 and Dec. 31, 1985; agreements which expired prior to Oct. 1, 1985 but new agreements were not reached by then; agreements which expired prior to Oct. 1, 1985 but for which necessary information had not been fully gathered; and agreements that have no fixed expiration or reopening date.

NOTE: Because of rounding, sums of individual items may not equal totals.

retail food stores, as well as those in construction which also faces slack demand in some parts of the country.

Some negotiators will be assessing wage and compensation structures that were first put in place the last time they bargained, usually in 1983 or 1984. These include annual lump-sum payments to workers and two-tiered wage systems, in which employees hired after a specified date are temporarily or permanently on a lower pay scale than those hired earlier. Other employers may wish to initiate these types of compensation.

Additional potential subjects for bargaining abound. To cite a few: Controlling the cost of employee benefits (especially health care); job security and job retraining; quality of work life; and altering work rules and job classifications for greater flexibility and efficiency.

Bankruptcies and corporate takeovers

Other developments will color the bargaining scene. A company filing for reorganization under Chapter 11 of the Bankruptcy Code can, under 1984 amendments to the code, ask the court for relief from the terms of a collective bargaining contract if it fails to reach agreement with the union on a contract modification. Some employees have participated in stock purchase plans of employers in financial difficulty in an attempt to save the corporation. Others have received stock in exchange for taking pay cuts. Unions have played an active role in some corporate takeover battles and have seats on the boards of some companies.

On the more traditional side of labor management relations, the number of major stoppages (involving 1,000 workers or more) continued a decline that began in 1980. In almost all preceding years back to 1947,[1] there were at least 200 and as many as 470 major strikes or lockouts. The number declined annually from 235 in 1979, to 187 in 1980, and to 62 in 1984, the fewest in 37 years and, based on events through the end of October, may hit a new low in 1985. Linked to the decline in stoppages is the increasing practice of workers to continue to work after a contract has expired, either under terms of the old contract or the employer's last best offer. At the end of September 1985, for example, 95 percent of the employees under private industry contracts that had expired and not been renewed were at work rather than on strike.

Nonunion wage gains again higher

In private industry, negotiators on the union side of the table will be bearing in mind the smaller wage and benefit increases that union workers have received compared to their nonunion counterparts during the last 2 years. The third quarter of 1985 was the seventh consecutive quarter in which wages and benefits increased more for nonunion than union workers, according to the Bureau's Employment Cost Index.

Bargainers will also be looking at recent settlements in other situations. Since the beginning of 1982, major settlements in private industry have, on average, provided record or near-record low wage adjustments since the series began in 1968. For the first 9 months of 1985, for example, settlements called for average wage adjustments of 2.3 percent the first year and 2.9 percent annually over the life of the contract. These figures highlight the tendency of recent settlements to provide smaller wage adjustments in the first contract year than subsequently. Prior to 1983, most settlements provided the largest wage adjustment in the first year.

Major settlements in State and local government since the beginning of 1984, when these data were first compiled, through the third quarter have averaged 4.7 percent the first contract year and 5.2 percent annually over the life of the contract.

Negotiators will also be considering what their expiring contracts yielded. Contracts expiring in 1986 specified wage adjustments averaging 3.1 percent a year over their term. When cost-of-living adjustments (COLA) made through October 1985 are included, the average rises to 3.6 percent. The following tabulation shows average annual wage adjustments alone and combined with COLA's in private and State and local government contracts expiring in 1986 (percentages calculated through the third quarter of 1985):

	Specified wage adjustment	*Specified wage adjustment plus COLA*
Contracts expiring in 1986	3.1	3.6
With COLA	1.9	3.1
Without COLA	4.0	—
Private industry	2.7	3.3
With COLA	1.9	3.1
Without COLA	3.6	—
State and local government	5.1	5.1
With COLA	4.4	4.9
Without COLA	5.1	—

In private industry, the specified adjustments under expiring contracts averaged 2.7 percent annually; when COLA's through September 1985 are included, they averaged 3.3 percent. These are the smallest adjustments under expiring contracts since the Bureau began tabulating these data 12 years ago. If the current trend in the Consumer Price Index continues, 1986 will be the fourth consecutive year in which total adjustments in expiring private industry contracts with COLA's will be less than specified adjustments in those without COLA's. Many contracts, however, provide for COLA review just prior to their 1986 expirations, so the difference in adjustments between those with COLA's and those without may narrow.

In State and local government contracts, specified adjustments in expiring contracts were 5.1 percent. COLA's cover such a small proportion of State and local government workers that their impact is minor.

All of these developments will contribute to the bargaining environment in 1986, but parties to contract negotiations will also have to contend with problems that are specific to their own situations. Principal industries involved in 1986 negotiations are: petroleum (January), farm machinery (March and June), health care (March through October), aluminum (May), copper (May), construction (spring and summer), State and local government (summer), steel (July), telecommunications (August), longshoring—East and Gulf Coast (September), and aerospace (fall). Some of the issues that will face labor and management in these industries are discussed below. The article concludes with highlights of wage changes and COLA reviews scheduled for the year under terms of major contracts negotiated earlier. (See table 3 for information on principal contracts.)

Petroleum refining

Contracts covering approximately 45,000 petroleum refinery employees and the major oil refining companies[2] will expire on January 8, 1986. Most of the Nation's refinery workers are represented by the Oil, Chemical and Atomic Workers Union (OCAW); others are represented by the Operating Engineers, Teamsters, Seafarers and independent or single-company unions.

This year's contract negotiations will take place in about the same economic environment as during the round of talks in 1984, although the institutional setting will be somewhat different. Approximately 140 refineries have closed between 1981 and the first half of 1985, with a corresponding drop in employment from 214,000 to 180,000 workers. Demand for U.S. petroleum products peaked at 18.4 million barrels per day in 1978 and fell steadily to 15.2 million in 1983. The fall in demand has been generally attributed to a shift from oil to other fuels (for example, coal and natural gas) for industrial uses, increased home insulation, and more fuel-efficient automobiles. Petroleum product demand increased slightly to 15.7 million barrels per day in 1984, but it was met mostly by imports, which increased by 15 percent. Domestic production increased by only 1 percent even though the industry was operating at only about 75 percent of capacity. Union sources fear that increasing imports will close more domestic refineries. Company mergers and takeovers have changed the bargaining structure of the industry.

On the employer side, merger activity has been brisk since 1981. In 1984 alone, for example, Texaco bought Getty, Mobil acquired Superior, and Phillips bought Aminoil. No recent merger, however, will have a greater impact on this year's bargaining than the 1984 purchase of Gulf by Chevron. Although negotiations have typically been conducted locally by each individual bargaining unit since 1975, the Gulf and OCAW agreements have served as the pattern for the rest of the industry. The OCAW will attempt to establish a pattern again this year, but it is not clear whether the union will be successful or, if it is, which company will emerge as the pattern setter for the industry.

The last round of settlements, in 1984, involved 338 separate contracts covering 50,000 workers. The Gulf OCAW accord provided wage increases of 1.5 percent in the first year and 2.5 percent in the second year and raised Gulf's monthly contributions to the family health insurance plans.

Although the Gulf settlement set the basic pattern for contracts in the industry, agreements with Texaco, Sun Oil,

[1] Totals are less than the sum of the parts because 65 agreements covering [illegible] workers have both reopenings and expirations in the reference period. Includes 576 State and local government agreements covering 2,149,000 workers.

[2] Includes 65 agreements covering [illegible] workers which have wage reopenings scheduled in 1986. Includes 230 State and local government agreements covering [illegible] workers.

[3] Includes 14 agreements covering 38,000 workers which have wage reopenings scheduled in 1987. Includes 177 State and local government agreements covering 744,000 workers.

[4] Includes 3 agreements covering 12,000 workers which have a wage reopening scheduled in 1988. Includes 74 State and local government agreements covering 405,000 workers.

[5] Includes agreements which were due to expire between Oct. 1 and Dec. 31, 1985; agreements which expired prior to Oct. 1, 1985, but new agreements were not reached by then; agreements which expired prior to Oct. 1, 1985, but for which necessary information had not been fully gathered; and agreements that have no fixed expiration or reopening date.

[6] Includes all private nonagricultural industries and State and local government.

NOTE: Because of rounding, sums of individual items may not equal totals.

and Union Oil, differed from the Gulf accord, and introduced a two-tiered classification. Company bargainers are expected to try to maintain the two-tiered wage structure, or introduce it where it does not exist, while the OCAW will probably try to eliminate it.

Demands for the coming negotiations adopted by the U.S. National Oil Bargaining Committee of the OCAW emphasize job security and health insurance. They include:

- A 2-year contract.
- "No retrogression" or concessions on current rights and benefits.
- "Substantial" wage increases for all classifications.
- Increased employer contributions to health insurance.
- Improvements in layoff protection, recall rights, severance pay, and transfer and relocation rights.

Construction

Approximately 606,000 construction workers are covered by collective bargaining agreements that will expire or be subject to reopening in 1986. They make up 57 percent of all construction workers under major agreements. Most of the 198 contracts will terminate between April and June.

Table 3. Duration and wage adjustment provisions of selected[1] major collective bargaining agreements

Industry[2] and employer	Union[3]	Number of workers[4]	Duration of agreement[5]	Month of 1986 COLA	Month and amount of 1986 specified wage increase
Private sector					
Manufacturing					
Food and kindred products					
California Processors, Inc. and others	Teamsters (Ind.)	20,000	July 1, 1985 to June 30, 1986	......	July: 10 to 45 cents

[1] Selection based on contracts with the highest employment (minimum 5,000) in the industrial classification.

[2] Based on 1972 standard industrial classification.

[3] Unions are affiliated with the AFL-CIO, except where noted as independent (Ind.).

[4] Number of workers at time agreement was reached.

[5] Contract effective date to expiration date or first reopening date.

[6] Subject to reopening during agreement term at not less than 6 months intervals.

[7] Equal to 2.25 percent of qualified earnings during 52 pay periods ending in September 1986.

[8] Allocation between wages and benefits will be determined by the union.

[9] Based on the corporate structure and employment level at the time of the 1983 collective bargaining settlement. On Jan. 1, 1984, AT&T was divested of its various operating companies under a settlement of an anti-trust action.

[10] Equal to 24 cents for each hour worked from June 1, 1986, to Nov. 30, 1986.

[11] Varying by job classification and based on hours worked from Oct. 6, 1985 to Apr. 15, 1986.

[12] Based on income during preceding 12 months and length of service.

Typically, most of the construction workers under collective bargaining agreements are employed in commercial construction (for example, office buildings, highways) rather than residential construction. Negotiations in the industry are usually conducted by local or regional branches of national employer associations, such as the Associated General Contractors of America or the National Electrical Contractors Association. Individual companies join such associations for a variety of business-related purposes, including collective bargaining. Workers are generally organized along craft lines, and negotiations are frequently on a craft-by-craft basis. Nevertheless, settlements reached by the various crafts in a locality are often similar in size, reflecting the economic situation of the local construction industry.

The economic health of the industry, while not good, has shown some improvement since 1982. In October of that year, the rate of unemployment in the industry hit a historic 23.7 percent. It dropped to 13.7 percent 2 years later, and has been hovering around that level since then. The value of new nonresidential construction, which ranged between $60 and $65 billion a year from 1981–83, rose to $74 billion in 1984 and was at $65 billion at the end of the third quarter of 1985.

In addition to having to deal with the problems of reduced construction activity and the consequent loss of job opportunities, unionized firms and their employees have faced increased competition from nonunion firms. Employers and workers have tried to adjust to both situations. Some unionized employers have used "double breasting"—forming new, nonunion firms—to avoid having to abide by the terms of union contracts and thus to be better able to compete with nonunion firms. Unions have agreed to reduce or freeze pay and benefits and to modify work rules to reduce labor costs. Some contracts permit a dual wage scale, with a lower rate to be paid on small projects where competition from nonunion firms tends to be heaviest. Similarly, on federally financed construction, if the prevailing wage rate that must be paid under the Davis-Bacon Act is determined to be less than the union scale, some contracts allow the employer to pay the lower rate, to be able to compete for the job. New "helper" classifications have been developed for workers who do not perform all the duties of the craft and are paid less than full craft rates. More direct approaches to reducing labor costs—wage and benefit cuts and freezes—have also been negotiated.

Since 1983, substantial proportions of workers covered by major construction contracts have had their wages cut or frozen for the term of the agreement—37 percent in 1983, 46 percent in 1984, and 30 percent during the first 9 months of 1985. The cuts and freezes, coupled with comparatively modest increases for the remaining workers, yielded average wage adjustments over the contract term that, since 1983, have been small relative to earlier years. During the first 9 months of 1985, contract settlements called for wage adjustments averaging 2.1 percent annually over their term. By comparison, adjustments specified in the contracts they replaced averaged 3.3 percent annually over their term, and 1982 settlements called for wage adjustments that averaged 6.3 percent a year over the life of the contract.

There is nothing on the horizon to indicate that 1986 bargaining in construction will produce settlements very different from those reached beginning in 1983.

Aluminum

Contracts between major aluminum producers and the United Steelworkers of America and the Aluminum, Brick and Glass Workers International Union are scheduled to expire in May 1986. These agreements cover about 45,000 workers.

The three largest companies, Aluminum Co. of America, Reynolds Metals Co., and Kaiser Aluminum and Chemical Corp. have traditionally been the pattern setters for smaller firms. The 3-year contracts negotiated in May 1983 gave no specified wage increases. They modified the quarterly cost-of-living adjustment to provide wage changes of 1 cent an hour for each 0.3-point movement in the Consumer Price Index (1967 = 100) for the first 2 contract years, and 1 cent for each 0.26-point change in the third contract year. Sunday premium pay was reduced from half to time and one-quarter. The eligibility period for extended vacation was increased from 5 years of service to 7.

After suffering heavy losses due to the depressed aluminum market, Kaiser Aluminum sought to modify the terms of the 1983 agreement to achieve additional labor cost savings. A new 3-year contract reached with the Steelworkers, effective April 1, 1985, reduced compensation by an average of $4.50 an hour, and established an employee stock purchase plan to be financed by diverting money stemming from any quarterly cost-of-living adjustment.

Earning levels among aluminum producers reflect their product mix. Companies such as Aluminum Co. of America and Reynolds Metals Co., have achieved a profitable product mix, while others, including Kaiser Aluminum, are facing financial difficulties. Despite the recent labor cost cuts, reduced employment and modernization of plant and equipment, Kaiser has not been able to make a profit.

Two forces are hurting the aluminum industry. First, few new markets have opened up since 1980, and the current annual growth rate for the industry is less than 3 percent. Second, foreign producers have expanded rapidly and obtained a competitive edge because of the strong U.S. dollar and labor and production costs that are lower than in the United States.

The domestic industry is doing what it can to meet foreign competition and halt the erosion in profits. Some aged, high cost domestic ingot plants have been closed, and products have been upgraded through expanded research and plant modernization. Producers can be expected to try to reduce labor costs, while union representatives will probably focus on job security.

Farm machinery

Contracts covering approximately 50,000 workers in the troubled farm machinery industry are scheduled to expire in March and June. Negotiations are slated between the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (UAW) and the Caterpillar Tractor Co., Deere and Co., and Klockmen-Humboldt-Deutz AG of West Germany, which acquired Allis-Chalmers Corp. farm machinery operations in 1985. Agreements with J. I. Case (a subsidiary of Tenneco's Inc.), which acquired International Harvester's farm machinery operations in January 1985, will not expire until 1987.

The farm machinery industry has suffered economic difficulty since the record sales of the 1970's. The 1980's have seen depressed farm values and low commodity prices discourage farmers' investment in new equipment. Voluntary and foreclosure sales of farms have resulted in a supply of used machinery at low prices. The strong dollar has hindered sales abroad, and there is increasing competition in both overseas and domestic markets from foreign manufacturers such as Kubota. American companies have reacted by curtailing output, offering substantial discounts on their products, and negotiating labor cost reductions.

Efforts to negotiate reduced labor costs began in 1982 with an early reopening of the UAW International Harvester contract. A new 29-month agreement did not provide any specified wage increases over its life, deferred the first 3 quarterly COLA payments for 18 months, and eliminated paid personal holidays. The accord also established an employee profit-sharing plan. In contrast, the subsequent 1984 agreement provided wage increases of 31 cents per hour effective October 1984, and 2.25 percent effective October 1985, and restored the COLA clause, paid holidays, and other benefits.

In February 1983, Allis Chalmers also negotiated a cost-reducing agreement which froze wages, suspended the COLA clause for 5 months, reduced holidays from 15 to 10 per year, and eliminated vacation and Christmas bonuses.

Caterpillar sought a similar labor cost saving contract. The May 1983 pact that ended a 7-month strike, froze wages but continued the COLA clause and established a profit-sharing plan. Contract provisions were introduced to improve job security. These included: advance notice prior to plant shutdowns or outsourcing, the use of a "master" recall list for hiring, and additional employer contributions to the Supplemental Unemployment Benefit (SUB) fund.

Deere and Co. settled with the UAW in July 1983 under terms similar to the Caterpillar agreement. However, the accord also provided a one-time "settlement bonus" of 40 hours' pay and a special 3.9 percent "COLA" payment.

Given the continued economic hardships faced by farm machinery producers, 1986 contract talks can be expected to emphasize job security provisions and labor cost-saving issues.

Health care

Contracts covering 106,000 of the 140,000 health care workers under major agreements are due to expire during 1986. If past practice is followed, two contracts will directly or indirectly set wages and working conditions for about 72,500 workers. A contract between the Greater New York Health Care Facilities Association and the Service Employees International Union (SEIU) expires in March. It covers 15,000 workers at about 55 nursing homes. When it was negotiated in June 1984, it also set the pattern for an additional 7,500 employees at 30 nursing homes which "followed suit," although they were not members of the association. Similarly, an August 1984 contract between the 50-member League of Voluntary Hospitals and Nursing Homes in New York, and District 1199 of the Retail, Wholesale, and Department Store Union (RWDSU) representing 38,000 employees of the League was a pattern setter for an additional 12,000 workers at 12 hospitals.

The industry has been under pressure from both State and Federal governments to hold down costs and to change its methods of pricing health care to patients. In 1983, the

Federal Government established reimbursement schedules for health care under Medicare and Medicaid under which the Government will pay only specified predetermined amounts for such services. Costs above the amount must be absorbed by the health facility, but if costs are below the amount, the difference is retained by the facility.

The 1984 settlements in New York reflected cost-containment pressures. Although wage and benefit increases were negotiated along with improvements in working conditions, they were contingent on Federal and State increases in Medicare and Medicaid reimbursement schedules. The increases were never approved and consequently the negotiated contract improvements were only partially effected.

The failure to fully implement the terms of the 1984 contracts will influence bargaining in the health care industry in New York. In the rest of the country, where 40,000 workers are under major contracts that will be negotiated, the issue of cost control will be a concern. Other problems will be addressed as well—job security, staffing patterns, contracting out of work, and the use of unpaid volunteers, for example.

In addition to RWDSU and SEIU, the American Nurses Association and the National Union of Hospital and Health Care Employees (which broke away from the RWDSU in 1984) will be bargaining over 24 contracts covering hospitals, nursing homes, clinics, and other health care facilities throughout the country.

Steel

Contracts between steel producers and the United Steelworkers of America, that originally covered approximately 275,000 workers (including those temporarily laid off), are scheduled to expire on July 31, 1986. Among the major companies that will be negotiating are Bethlehem Steel Corp., Inland Steel Co., U.S. Steel Corp., Armco Inc., National Steel Corp., LTV Steel Corp., and Laclede Steel Co. For the first time in three decades, all the companies will be bargaining separately.

Depressed economic conditions in the U.S. steel industry have contributed to the demise of one of its most venerable practices—coordinated bargaining between the United Steelworkers of America and the major steel producers. Industry-wide bargaining provided individual major steel producers a united voice in the negotiation but at the same time deprived them of the ability to alter labor costs to meet individual company circumstances. It enabled the United Steelworkers to maintain wage uniformity across the industry, shielding wages from competition. Twelve companies participated in the process in 1956 when the unified approach was initiated. Subsequently, the number of companies that bargain together shrank to nine in 1980 and to seven when the last national agreement was negotiated in 1983. When it dissolved in May 1985, the coordinated bargaining committee consisted of five members, U.S. Steel Corp., Bethlehem Steel Corp., Armco Inc., Inland Steel Co., and LTV Steel Corp.

In the last 3 years, the U.S. steel industry has experienced staggering losses, layoffs, and plant closings as a result of its continued inability to compete with foreign producers in shrinking overseas and domestic markets because of outdated equipment, and higher labor costs. The industry's financial losses totaled nearly $7.1 billion between 1982 and 1984. Overall employment has declined from 256,000 in 1983, when the expiring contracts were negotiated, to 200,000 early in September 1985.

Steel imports in 1983 and 1984 depressed domestic steel shipments and prices. Imports accounted for 20.5 percent of the U.S. market in 1983 and captured a record high of 26.4 percent of domestic consumption in 1984. U.S. steel producers together with United Steelworkers of America, members of Congress, and local public officials mobilized support for Federal legislation to limit steel imports to 15 percent of the U.S. market. In September 1984, President Reagan announced a program to reduce annual imports of finished steel products to 18.5 percent for a period of 5 years. In the first 9 months of 1985, however, imports accounted for about one-fourth of the market, depressing the demand for domestic steel.

Steel companies have initiated various approaches to deal with their distressed situations. For example, Wheeling-Pittsburgh, the seventh largest steel maker, borrowed heavily for modernization and entered into a joint venture with Japan's Nisshiu Steel Co. Two renegotiations of contracts with the Steelworkers resulted in wage and benefit cuts in exchange for the establishment of an employee stock ownership plan. All these efforts were not sufficient to solve the company's financial problems. The company filed for bankruptcy after heavy losses in the first quarter of 1985. While operating under Chapter 11 of the Federal Bankruptcy Code, Wheeling-Pittsburgh won court approval to annul its labor pact. The company's move to reduce wages and benefits by 18 percent, to $17.50 an hour, was rejected by the 8,200 Steelworkers. They walked off their jobs on July 21, 1985, in the steel industry's first major walkout since the 116-day industrywide strike in 1959.

On October 26, 1985, the Steelworkers ratified a new contract reducing compensation to $18 an hour. The accord replaced the company's pension plan with a less costly one and provided workers a greater role in the company's financial management. The pact linked wages to the price of steel—for each 1-percent rise in the company's steel price, workers will receive 20 cents more an hour, for a maximum of $1 an hour. Implementation of this contract required the approval of the Federal bankruptcy court and the main creditors of the company.

Other companies have adopted measures such as reducing excess capacity, selling profitable operations to acquire working capital and entering new ventures with foreigners. Armco, for example, closed a steel mill in Houston, sold coal reserves and announced the sale of its aerospace business in August 1985. Inland closed its operation at Indian Harborworks in Chicago; LTV idled its operation in Aliquippa, PA, and put its specialty steel-producing company up for sale as part of a restructuring of its steel operations; U.S. Steel is negotiating a partnership with South Korea's Pohang Iron and Steel Co.

The expiring agreement was negotiated in February 1983 and replaced a contract that still had 5 months to run. Faced with the need to deal with rapidly rising unemployment and financial losses, the Steelworkers and the members of the Coordinated Bargaining Committee had agreed to early contract talks in mid-1982. After twice failing to reach agreement, the employers and union settled on a 41-month contract that provided labor cost cuts in return for improvements in job security and increased aid to laid-off workers. The contract temporarily cut wages $1.25 an hour and eliminated the 6-cent cost-of-living increases paid but, under the terms of the superseded 3-year agreement, not incorporated in the wage rate. The quarterly cost-of-living payments were suspended until July 31, 1984. The extended vacation plan was eliminated. Vacations, holidays, and Sunday premium pay were temporarily reduced. The companies raised their contributions to supplemental unemployment benefits by 50 cents an hour.

Although specific goals for the coming negotiations have not yet been set, the continued economic difficulties of the industry and their effect on the companies and the workers will be the focus of attention. Reducing labor costs and protecting job security will undoubtedly be major issues. Unlike the negotiations over the last three decades, 1986 bargaining will see each major producer trying to achieve contract terms best suited to its own circumstances.

Copper

Approximately 14,000 workers in the copper industry are covered by collective bargaining agreements scheduled to expire in May 1986. The major companies that will be involved in the negotiations are Kennecott Corp; Magma Copper Co.; Inspiration Consolidated Copper Co.; American Smelting and Refining Co. (ASARCO); and U.S. Metals Co. A coalition of unions, led by the United Steel Workers, will represent the workers at these contract talks.

The copper industry has been plagued by falling prices and falling demand, resulting in net losses in 1984 for the large copper producers—Kennecott, ASARCO, and Phelps Dodge. In 1980, metal mining in the United States was a $8.5-billion enterprise. By 1983, it had shrunk to $5.9 billion. U.S. copper producers cut output in 1983 to 1 million metric tons from 1.6 million tons in 1982. Nevertheless, copper supplies have continued to pile up due to abundant foreign copper. Substitution of plastic and optic fibers for copper and a decline in the grade of the available ore are other factors weakening the copper mining industry in the United States.

The industry's most visible problem is prices. Price setting, once the province of North American oligopolies, shifted in the 1980's to the floor of world commodities exchanges, chiefly the London Metal Exchange. Copper prices have dropped as copper output increased in Third World countries. In 1984, the price of copper fell below 70 cents a pound or 15 to 17 cents below the break even point for the best U.S. mines.

The 1983 contracts negotiated by Kennecott, Magma Copper Co., American Smelting and Refining Co., Inspiration Consolidated Copper Co., and U.S. Metal Co. established a pattern for most of the copper mining and processing industry. The agreement froze wages for its 3-year term but continued the quarterly cost-of-living adjustment providing 1 cent for each 0.3-point change in the CPI. Benefits were frozen for incumbent workers and reduced for anyone hired after July 19, 1983.

Contract talks failed to yield an agreement with Phelps Dodge Corp., resulting in a strike by a 12 union coalition led by the Steelworkers that began on June 30, 1983. Phelps Dodge, the Nation's No. 2 copper producer, had temporarily shut down all its mining operations between April 1982 and the end of the year, putting 3,800 employees out of work. When negotiations began in 1983, the company proposed to abolish the cost-of-living adjustment clause, freeze wages, and reduce benefits. The union refused to deviate from the terms of the earlier settlement with Kennecott and the Nation's other top copper producers. Phelps Dodge has continued operating its mines despite the strike. Elections to decertify the union have been held. The union lost these elections but the results are being appealed.

As bargainers prepare for 1986 negotiations, U.S. copper producers are still confronted by falling prices, heavy losses, and a depressed market for their products. They are expected to seek cuts in wages and benefits. The unions intend to maintain the tradition of pattern bargaining and will attempt to gain job security provisions.

Telephone communications

No industry will have a more dramatically different bargaining setting in 1986 compared with earlier years than the telephone industry. Instead of bargaining over a single national agreement on wages and benefits for American Telephone and Telegraph Co., the industry may see bargaining over more than 20 separate agreements. This change stems from the January 1984 breakup of AT&T from a single national company providing local and long distance service, into a company providing national long distance and allied services—AT&T Information Systems (ATTIS)—and seven independent regional companies consisting of 22 local operating companies. In August 1983, before the divestiture, a 3-year national agreement was reached with AT&T by the Communication Workers of America (CWA), the International Brotherhood of Electrical Workers, and the Telecommunications International Union. The agreement, which remained in effect for the companies created by the breakup of AT&T, was negotiated after a 22-day strike. The major issues that faced the bargainers were job security and income protection in light of expected cuts due to the divestiture. The accord provided:

- A new personal or career development training program financed by the company to provide training which would be considered when transferring employees;
- An improved Supplemental Income Protection plan for workers who leave the company due to technological change or other reasons resulting in layoffs or involuntary reassignments to lower-paying jobs or to work locations requiring a change in residence;
- Improved reassignment pay protection for downgraded employees.

The pact provided an immediate 5.5 percent pay increase for workers at the top of the progression scale, smaller increases for those at lower steps, and no increase in starting rates. All employees, including those working at starting rates, were guaranteed an increase of at least $2.50 a week. In August of 1984 and 1985, there were additional increases of 1.5 percent at the upper rates, lesser increases at intermediate rates, but no change in starting rates. The COLA formula was unchanged.

Since the last negotiation and the breakup of AT&T, there have been significant cuts in employment. Local companies have reduced employment by about 40,000, largely through the use of new technology, increased contracting out of jobs, and the use of smaller crews of craftworkers to cover larger geographic areas. In August 1985, ATTIS announced it was going to lay off about 10,000 workers. This led the CWA to take a strike vote—an unusual event during the term of an agreement. The union maintained that the company was violating contract provisions on subcontracting and a 1982 promise not to lay off workers for 7 years. A strike was averted on October 30, 1985, when the company announced a reduction in the number of layoffs contemplated, and agreed to provide the union with information on subcontracting.

This summer's negotiations will cover about 486,000 employees of the former AT&T. Companies involved are: ATTIS, composed of Bell Laboratories, Western Electric, and the Long Lines Department (a total of 174,000 employees) and seven regional companies: U.S. West (34,000 employees), Ameritech (43,000 employees), Bell Atlantic (30,000 employees), Nynex (29,000 employees), Bell South (68,000 employees), Southwestern Bell (51,000 employees) and Pacific Telesis (57,000 employees). These 7 regional companies consist of the 22 independent Bell operating companies, each of which retains local regulated monopolies to provide local telephone service and provide other services on a competitive basis, such as selling telephone equipment and publishing the "Yellow Pages" directory. CWA will be led in negotiations by President Morton Bahr, the former head of CWA's New York District, who was elected to succeed the retiring Glenn Watts in July 1985.

The structure of the coming talks is still uncertain. While CWA will not attempt to negotiate a national contract, it is still seeking a national patttern. It has set up two separate bargaining councils—one to bargain with ATTIS and one to bargain with the regional companies. CWA will bargain nationally with ATTIS and hopes to bargain separately with each of the seven regional companies. However, several regional companies are resisting this effort and want to negotiate a separate agreement for each operating company in the region.

CWA intends to maintain uniform benefits and wages across the country but may have problems doing so because of diverse local cost conditions, the varying financial strength of each company, and the rapid creation of new jobs and skills that could make it difficult to compare job titles, duties, and lines of promotion across companies.

Another major focus of bargaining will be the union's desire to negotiate for job security as opposed to the companies' interest in reducing employment through job restructuring and technological change. Other major bargaining issues will include improved health insurance, improved safety on the job, and participation in "quality of worklife" programs.

Other telecommunication companies will also be bargaining in 1986. Contracts with General Telephone and Electric expire in the spring; they cover about 40,000 workers.

Aerospace

About 100,000 aerospace workers are covered by major collective bargaining agreements scheduled to expire this fall and during the first half of 1987. Among the major aerospace companies that will be negotiating are the Boeing Co., McDonnell Douglas, Bendix Aerospace (a subsidiary of Allied Corp.) Rockwell International Corp., Lockheed Aircraft Corp., United Technologies, and General Dynamics Corp. The two major unions involved are the International Association of Machinists and Aerospace Workers (IAM) and the International Union of United Automobile, Aerospace and Agricultural Implement Workers of America (UAW).

Since the last round of negotiations in 1983, the aerospace industry has had an increase in production of military goods and a growth of conglomerates and joint ventures. In 1984, the industry had the largest sales volume (in current dollars) in its history. Weak commercial aircraft sales (in 1984, 185 commercial transports were delivered compared to 702 in the peak year of 1968) were more than offset by increased sales of military aircraft, missiles, and space products.

Several factors have contributed to the increase in merger activity and joint ventures. Excess capacity, reduced demand for civilian aircraft, high interest rates, and uncertainty about fuel costs and new technology have beset the industry. Furthermore, aerospace companies often make large up-front investments which yield low-volume production runs. Through joint ventures, development and production costs are shared. The result has been increased coproduction among U.S., European, and Japanese firms.

The number of U.S. aerospace companies has declined in recent years because of mergers. Some examples in 1985 include Rockwell International's acquisition of Allen Bradley, Textron's purchase of AVCO, and Allied Corp.'s buyout of the Signal Companies. Recent mergers have also diversified nonaerospace companies such as Chrysler Corp., which purchased Gulfstream Aerospace, and General Motors, which acquired Hughes Aircraft.

Recent rounds of negotiations have been on a company-by-company basis with the earliest settlements usually establishing a pattern for the rest of the industry. Specific terms and expiration dates, however, have varied.

During the last round of bargaining that began in October 1983, the Boeing Co. and the IAM settled on a 3-year agreement. The contract called for no specified wage increases but provided an annual lump-sum payment each December of 3 percent of earnings during the 12 months ending the previous October. Employees received a 3-percent COLA "prepayment" each October, which was offset by quarterly COLA adjustments. In an effort to slow wage compression between grades, employees in specified lower grades did not receive the prepayments in 1984 and 1985. The accord also established a two-tiered wage structure, reduced pay scale for employees in lower grades and introduced a "new technology" clause which provided employee training. This settlement, with some modifications, established a general framework for most agreements in the industry. McDonnell–Douglas reached a similar agreement with the UAW in 1984, after a 117-day strike over the issue of lump-sum payments. The UAW opposed them because they were not incorporated into basic wage rates and thus the hourly wage base remained the same. Also, lump-sum payments may not be reflected in some benefits. McDonnell–Douglas later negotiated a 3-year contract with the IAM, replacing the contract that expired in May 1984.

Negotiations this year will be influenced by strong profits in the industry and forecasts of record sales. Civilian aircraft sales are anticipated to improve as airlines move to replace outdated equipment to take advantage of lower operating costs of new equipment. Military and space sales are also expected to increase. However, the Defense Department will probably encourage aerospace contractors to keep costs from rising. Two-tier wage structures are likely to be an issue in light of the decisions to drop them at Hughes Aircraft in 1984 and at General Dynamics in 1985. Lump-sum payments are also expected to be a topic for negotiation.

Longshoring

Contracts covering 50,000 dockworkers in 36 East and Gulf Coast ports are scheduled to expire on September 30, 1986. Negotiations are expected to begin in April between the International Longshoremen's Association (ILA) and the

Table 4. Scheduled deferred wage changes in 1986 under major collective bargaining agreements, by industry

Selected industry	Number of agreements	Number of workers (thousands)	Mean change							Median change		Mean increase

[1] Percent of straight-time average hourly earnings.

[2] Includes all private nonagricultural industries and State and local government.

[3] Includes workers in the following industry groups for which data are not shown separately to ensure confidentiality of earnings data: Tobacco (2,000); lumber (4,000); leather (8,000); paper (65,000); printing (18,000); chemicals (16,000); leather (12,000); stone, clay, and concrete (19,000); instruments (1,000); and miscellaneous manufacturing (5,000).

[4] Includes 100,000 workers in the mining industry for which data are not shown separately to ensure confidentiality of data.

NOTE: Workers are distributed according to the average adjustment for all workers in each bargaining situation considered. Deferred wage increases include guaranteed minimum adjustments under cost-of-living clauses. Because of rounding, sums of individual items may not equal totals.

employer associations representing ocean-going carriers, stevedoring firms, marine terminal operators, and others that move ocean passengers and freight.

The ILA will bargain over a master agreement with a steering committee representing 10 associations and companies. The master agreement covers issues such as wages, hours of work, contract duration, and employer contributions to pension, health, and welfare funds. After a master agreement is reached, local agreements must be negotiated at all ports. They deal with the guaranteed annual income (GAI) plan, holidays, vacations, working conditions, and the amount of pension and welfare benefits paid out.

After more than 10 years of litigation that twice involved the U.S. Supreme Court, rules requiring that longshoremen handle ocean-going containerized cargo within 50 miles of port, first negotiated in 1974, will not be an issue this year. In June 1985, the Supreme Court found that issues involving handling of containerized cargo were legitimate topics for bargaining and permitted the implementation of the rules.

October	188	Bituminous coal
November	57	...
December	101	Food stores, construction

[1] Includes 1,159,000 workers under state and local government agreements.

[2] This total is smaller than the sum of individual items because 422,000 workers are scheduled to receive more than one increase. It is based on data available as of Oct. 1985, and thus may understate the number of workers scheduled to receive deferred increases for the entire year; 13,500 workers are scheduled to have a deferred wage decrease in 1986.

In 1983, negotiation of a 3-year master contract was completed more than 4 months before the October 1, 1983, expiration date of the existing contract. It provided wage increases of $1 an hour on October 1 of 1983, 1984, and 1985 and a $1.25-an-hour increase in employer payments to benefit funds over the life of the contract. However, while local issues were still being negotiated, the Federal Maritime Commission asked for a Federal injunction to stop the implementation of containerized cargo rules. The ILA suspended local talks, but a strike was avoided by the negotiation of a stopgap 106-day master agreement which allowed local talks to continue. The containerization issue was subsequently partially resolved, and the terms of the original agreement were carried out.

Among the issues addressed by the local negotiations in 1983 was the GAI plan, which guarantees eligible workers a specified number of hours of pay per year, whether or not they work. The number of guaranteed hours, which varies from port to port, was raised in some ports but lowered in others.

At this time, the major bargaining issues for 1986 remain unclear. The ILA has expressed concern that "dummy" companies have been established by employers using nonunion workers. Both parties are intent on maintaining the competitive position of the ports in which they operate.

State and local government

There are 239 major State and local government contracts scheduled to reopen or expire during 1986. The agreements cover 741,000 workers. These include 53 State contracts covering 273,000 workers and 186 local agreements involving 468,000 workers. Of the total, 127 contracts for 370,000 workers terminate in June. Expiring contracts cover about one-third of the workers under major agreements in both State and local government.

About half the workers covered by expiring or reopening State contracts are in general administration, 9 percent work for higher education institutions, and the balance are employees in a variety of activities, including hospitals, social services, and protective service agencies. Three States account for about one-half of all State workers under major contracts slated for bargaining in 1986: New Jersey (57,000 workers), Massachusetts (51,000), and Illinois (29,000).

On the local government level, 59 percent of the workers under expiring contracts are in education, 23 percent are in general administration, and 13 percent are in protective services. Bargaining will be widely scattered—no single jurisdiction will account for as much as 6 percent of the workers for whom new contracts will be negotiated.

During the first 9 months of 1985, major contract settlements provided first-year wage adjustments of 4.7 percent in both State and local government, and average annual adjustments of 4.8 percent in State government and 5.6 percent in local government over their term.

Concern for limiting labor cost increases was reflected in many agreements. Some provide two-tiered wage and benefit structures, in which new hires receive lower wages and/or benefits than incumbent employees. Others establish or increase worker copayments for health and other benefits.

Workers in public education constitute the largest bloc of employees (273,000) for whom new agreements will be negotiated. The vast majority are teachers. Depending on the jurisdiction, contracts may cover all employees—teachers, aides, custodians, and so on—or there may be a separate agreement for each job classification. The National Education Association (Independent) and the American Federation of Teachers (AFL-CIO) are the dominant unions representing workers in public education.

During the first 9 months of 1985, settlements in primary and secondary education called for average wage adjustments of 5.3 percent the first year and 6 percent a year over the contract duration. Wages will continue to be a concern for both employees and employers in 1986 for the usual economic reasons. Another issue, however,is the shortage of qualified teachers in some school systems and the role that higher pay could play in attracting sufficient people to the profession. By 1995, 639,000 additional educators will be needed, according to a recent forecast.[3] Bargaining will focus on a variety of other issues as well, including merit pay, class size, and noninstructional duties for teachers.

On April 1, 1984, Ohio passed a law giving approximately 52,000 State and 134,000 local government employees the right to bargain over wages and benefits and a limited right to strike. Seven unions and employee associations are competing to represent workers in a number of bargaining units defined along functional lines (for example, hospitals, highway maintenance, educa-

tions on initial contracts are expected in 1986 and will focus on wages as well as general working conditions, benefits, and promotion opportunities.

Scheduled wage changes in 1986

About 3.7 million of the 9.1 million workers[4] under major collective bargaining agreements are scheduled to receive deferred wage changes in 1986—37 percent of those in private industry and 54 percent of those in State and local government. Except for 13,000 workers in private industry who have a deferred *decrease*, all the workers with wage changes will get increases. (See tables 4, 5 and 6.) Some workers will receive lump-sum payments during the year; such payments are not included in this series.

Deferred changes (increases and decreases) will average 4.3 percent—3.9 percent in private industry and 5 percent in State and local government. In private industry, deferred changes negotiated in 1983 will average 3.7 percent; those from 1984 will average 4.0 percent; and those from 1985 will average 4.1 percent. Comparable data are not available for State and local government.

Contracts with COLA's generally provide smaller deferred wage increases than those without because the COLA clause is expected to generate some additional wage increases. In 1986, deferred wage adjustments will average 3.6 percent for agreements with COLA's, compared to 4.1 percent for those without COLA clauses.

Cost of living adjustments

As of the end of the third quarter of 1985, 3.5 million of the 9.1 million workers under major agreements were covered by COLA clauses. (See table 7.) Almost all are in private industry, where half the workers under major agreements have COLA coverage. Only 2 percent of the workers under major agreements in State and local government have COLA's.

Table 8. Workers under cost-of-living adjustment clauses in collective bargaining situations, 1971–86

[Numbers in millions]

Year[1]	Total of workers	With COLA coverage	
	Number	Number	Percent

1981	9.1	5.3	58.2
1982	9.0	5.1	56.7
1983	8.5	4.9	57.6
1984	7.9	4.5	57.3
1985	7.5	4.2	56.7
1986	7.0	3.5	50.0

[1] Data relate to information available as of October 1 of preceding year.

Both the number and proportion of workers with COLA coverage in private industry decreased gradually from 1979 to 1984. (Comparable data are not available for State and local government.) These decreases stemmed largely from declining employment in industries where COLA clauses were common. During 1985, however, COLA coverage fell sharply (from 56.7 to 50 percent) because settlements for more than 300,000 workers (primarily in trucking and cotton garment manufacturing) dropped COLA clauses. Table 8 shows the number of workers under major private sector contracts and the number and percent covered by COLA clauses, 1971–86.

[1] Includes 8 state and local government agreements covering 25,200 workers.

[2] Includes monthly, combinations of annual and quarterly, combinations of annual and semiannual, and reviews dependent on the levels of the Consumer Price Index.

[3] Includes 3 State and local government agreements covering 8,300 workers.

[4] Includes 5 State and local government agreements covering 16,900 workers.

[5] Agreements that have at least one review in the year.

NOTE: Data include only cost-of-living reviews through the termination of the present agreement; does not assume continuation of reviews after expiration dates. Because of rounding, sums of individual items may not equal totals.

Cost-of-living reviews are made at intervals specified in each clause. Fifty-two percent of the workers covered by COLA clauses will have at least one review in 1986. (See tables 7 and 9.) Annual reviews affect 1.4 million workers, primarily in telephone communications and apparel industries; quarterly reviews cover another 1.4 million workers including those in automobile, steel and aerospace; and semiannual reviews cover 570,000 employees, mostly in the railroad and electrical products industry.

About 3.3 of the 3.5 million private industry and State and local workers with COLA clauses have possible adjustments tied to the movement in the CPI for "all cities." Most of the remainder have clauses based on an index for an individual city.

About one-quarter of a million workers are covered by a contract clause that specifies a "guaranteed" or minimum COLA payment. Adjustments under these clauses were determined at the time the contracts were negotiated and do not depend on the movement of a price index. Therefore, the Bureau of Labor Statistics treats them as specified wage adjustments and not as COLA's. Payments above the specified amount that relate to changes in the CPI are, however, considered COLA's.

Many of the contracts expiring in 1986 have COLA clauses that were modified from earlier agreements to reduce employer costs related to COLA's. Changes included deferral of COLA payments, diversions of COLA adjustments from wages to pay fringe benefits, suspension of payments, formulas that provide smaller increases, and maximum payments or "caps." These modifications are one more issue that bargainers will have to wrestle with in 1986. □

A note on communications

The *Monthly Labor Review* welcomes communications that supplement, challenge, or expand on research published in its pages. To be considered for publication, communications should be factual and anaytical, not polemical in tone. Communications should be addressed to the Editor-in-Chief, *Monthly Labor Review*, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

State labor legislation enacted in 1985

In a heavy legislative year, major laws were enacted in many traditional areas, and new measures included restricting door-to-door sales by children and requiring background checks of day care personnel

RICHARD R. NELSON

There was a significant amount of both legislative activity and court action in the States during 1985, covering a wide variety of subjects in the field of employment standards.[1] Major laws were enacted concerning many of the traditional issues such as minimum wage protection, collection of unpaid wages, bans on employment discrimination, public employee collective bargaining, and restrictions on the use of polygraph examinations. Legislation on the rights of employees to receive information and training about toxic substances found on the job site was passed in several additional States, and interest also continued involving pay equity for job of "comparable worth" and the impact on employees of plant closings or relocations. New measures evidenced interest in restricting door-to-door solicitation by children, requiring background clearances of day care employees, and governing the use of video display terminals in the workplace. Three States repealed prevailing wage laws, which set wage rates for publicly funded construction.

Montana, Oregon, and Vermont enacted legislation this year providing for across-the-board minimum wage rate increases effective in 1985 or 1986; a wage order revision in the District of Columbia raised the minimum wage applicable to manufacturing, printing, publishing, and wholesale trade occupations; and mandatory decree revisions in Puerto Rico increased rates applicable to employees of the personal services and communications industries. In addition, minimum wage rates were raised in Arkansas, Illinois, and Maine as the result of automatic increases provided for by previous enactments. The $3.35 per hour Federal standard is now exceeded in Alaska, Connecticut, the District of Columbia, and Maine, and the rate in Vermont is scheduled to increase from $3.35 to $3.45 per hour on July 1, 1986. As of January 1, 1986, 20 jurisdictions have minimum wage rates equal to the Federal standard and Montana will reach this level on October 1, 1986. A new North Carolina amendment requires matching increases up to $3.60 an hour in the State minimum if the Federal rate is increased before July 1, 1987.

Among other minimum wage and overtime actions, the New Hampshire provision permitting a youth rate of 75 percent of the applicable minimum wage rate was limited to those age 16 or under rather than those 17 or under as before, and an Executive Order was issued in Maine in response to the U.S. Supreme Court ruling of February 19, 1985 in *Garcia vs. San Antonio Metropolitan Transit Authority et al*. that State and local governments are subject to minimum wage and overtime provisions of the Federal Fair Labor Standards Act. The Maine order establishes scheduling and other procedures to ensure that the State does not incur Federal overtime liability beyond its ability to pay.

The Oregon wage payment and collection law was amended to extend coverage to public sector employees,

---

Richard R. Nelson is a State standards adviser in the Division of State Employment Standards Programs, Office of State Liaison and Legislative Analysis, Employment Standards Administration, U.S. Department of Labor.

and coverage was also extended to additional categories of employees under these laws in Illinois and Iowa. Also, in Oregon, an employer-financed wage security fund was established to pay wage claims of employees whose employers have ceased doing business and do not have sufficient assets to pay the claims. The Labor Commissioner in New York and the Director of Labor and Industries in Washington were authorized to enter into reciprocal agreements with other States for collection of claims or judgments for unpaid wages. In Illinois, wages collected by the Department of Labor which cannot be paid to affected employees will now be deposited into the State's general revenue fund, rather than returned to the employer. Employers in Nevada are now forbidden to require employees to work without wages during a trial or break-in period. In a signficant decision, on September 6, 1985, a U.S. Court of Appeals reversed and remanded a District Court decision which had held that the Federal Employee Retirement Income Security Act of 1974 preempts a California statute barring forfeiture of vacation pay and requiring payment of a pro rata share of such pay on the employee's termination.

State prevailing wage laws, which specify that wage rates paid on publicly funded construction contracts be not less than those prevailing in the locality, continued to be of great interest and controversy with measures to repeal, enact, or amend laws introduced in many States. Currently, 34 States have prevailing wage laws in effect. Laws were repealed this year in Colorado, Idaho, and New Hampshire, and a repeal bill passed the legislature in Louisiana but was vetoed by the Governor. In contrast, a bill to enact a prevailing wage law passed the legislature in Iowa but was blocked by veto. Several major amendments were made to the Oklahoma law including raising the threshold amount for coverage to $600,000, requiring use of rates determined under the Federal Davis-Bacon Act, providing for debarment of contractors in violation of the law, and making the public awarding agency liable for underpayment of wages in certain situations. Amendments in Nevada increased the threshold amount, provided for debarment, and required setting prevailing rates in each county through the use of an annual survey. Dollar threshold amounts were also increased in Connecticut and Wisconsin. The labor commissioner in Montana was given rulemaking authority under the State's law, and New York may now withhold payments due contractors who fail to provide requested payroll records. In Illinois, a Circuit Court judgment, affirmed by a State Appellate Court and currently on appeal to the State Supreme Court, has upheld the right of certain cities and counties with home-rule status under the State constitution to continue to exempt themselves from coverage of the prevailing wage law.

Most States have enacted laws to strengthen enforcement of court-ordered child support, in total or partial compliance with new Federal requirements under the Child Support Enforcement Amendments of 1984.[2] These amendments require that State laws must provide for automatic wage withholding to cover overdue and current child support, must limit the total wages withheld to the garnishable limit set in the Federal wage garnishment law, and must provide a fine against an employer for retaliating against an employee or job applicant because of such withholding.

Again this year, the issue of equal pay for jobs of comparable value in State government was addressed in some of the States. Among the more notable actions taken, the legislatures in Washington and Wisconsin appropriated money for comparable worth implementation, an evaluation of the State job classification system based on comparable worth principles was funded in Wyoming, and in New Jersey, an interim task force report was submitted recommending pay increases for certain employees and implementing legislation was introduced. A study of comparable worth for State employees was authorized in Utah, while North Carolina repealed a 1984 law providing for a similar study and the development of a job evaluation and pay system. Significantly, a 1983 U.S. District Court decision ordering comparable pay for Washington State employees was overturned on appeal in September 1985.

There was little activity this year related to child labor law or regulations with the notable exception of a few measures adopted relating to the employment of minors in door-to-door sales. Such work was prohibited for children under age 15 in Oklahoma and for those under 16 in Oregon. Oregon also issued special rules for the employment of 16- and 17-year-olds in employment of this kind, and Arizona amended its' night work hours restrictions to prohibit work after 7 p.m. in door-to-door solicitation. In other developments, a new Wisconsin law permits minors under age 12 to work in fundraising sales for nonprofit organizations with parental consent, and Illinois adopted new certificate requirements for minors under 16 employed in motion picture, radio, or television productions.

Legislation involving at least one of the various forms of employment discrimination was enacted in 24 jurisdictions in 1985 with primary concentrations being in the areas of discrimination on the basis of age and handicap. Among these, New Jersey prohibited mandatory retirement because of age in both the private and public sectors, except for State police officers, and Montana will no longer require mandatory retirement of firefighters and law enforcement personnel under their retirement systems. Also, a new Oklahoma law bans age discrimination in employment against persons between the ages of 40 and 70, and coverage of Louisiana's law against discrimination because of age was expanded to include employers subject to the Federal Age Discrimination in Employment Act. New laws were enacted or coverage of existing fair employment practice laws amended to provide handicapped persons protection from employment discrimination in Arizona, Nevada, North Carolina, and Wyoming. The Nevada law, banning discrimination by the State and political subdivisions, was also amended to prohibit discrimination on the basis of political affiliation.

Eight additional States enacted laws affording workers the right to be informed of and given training on toxic substances found in the workplace. Some of these laws extended the right to information to the communities in which companies using toxic substances are located, and three States, with prior laws giving protection to employees, enacted separate laws providing exclusively for community right-to-know.[3] These laws on toxic substance information, while originating in only the last few years, have now been enacted in a majority of the States.

Other occupational safety and health measures included a New Hampshire act limiting application of that State's law to public sector employees, an Oregon field sanitation law requiring employers of specified farm workers to provide them with convenient toilet and handwashing facilities and clean drinking water, and other laws relating to asbestos, elevator, mine, boiler, and amusement ride safety. An Executive Order was issued in New Mexico regulating the use of video display terminals by State employees.

Comprehensive new laws in Hawaii and Vermont prohibit employers from requiring employees to take a polygraph test as a condition of employment or continued employment. Other enactments of interest this year include: several laws adopted requiring criminal history checks of prospective child care operators or workers; measures by Connecticut, Maryland, New Jersey, and Washington to aid workers and communities facing mass layoffs or plant closings; a State and Political Subdivision Employees Relations Act in North Dakota giving public employees the right to join employee organizations; a law in Mississippi making strikes unlawful by public employees generally, and specifically by public schoolteachers; a right-to-work law enacted in Idaho; several laws each giving preference to State contractors or residents on public work projects and prohibiting reprisal against public employees who report a violation of law or mismanagement; laws restricting smoking in the workplace; and a new measure in Tennessee making it unlawful to knowingly employ or refer for employment any illegal alien, with employer penalties including having their license revoked and being permanently barred from doing business in the State.

The following is a summary, by jurisdiction, of labor legislation during 1985.

Alabama

Wages. The State comptroller is to adopt statewide policies for the deduction from salaries, upon the request of at least 5 percent of all State employees, of membership dues, voluntary contributions, and group insurance premiums. The deductions are to be appropriately remitted.

Equal employment opportunity. The requirement that teachers retire at age 70 was amended to permit continued employment from year-to-year on application and employer approval, if evidence of physical and mental fitness is furnished.

Background clearance. Employers hiring persons to work in public or private schools, child care, and correctional facilities must request from the public safety department records of all sex crime convictions of prospective employees or volunteers, and current employees and volunteers are to submit a signed statement regarding such convictions. Other employers, using the services of volunteers or employees in positions having supervisory or disciplinary power over children, are also to obtain signed statements disclosing any such prior sex crime convictions.

Occupational safety and health. A new law was adopted to ensure that employees be given information concerning the nature and health effects of the toxic substances with which they work. The Department of Environmental Management is to promulgate and make available to manufacturers and employers a list of toxic substances. Employers are to maintain material safety data sheets for toxic substances used in the workplace, and provide education and training to employees on safe handling, emergency treatment, and the hazards involved. Employees have a right to obtain the data sheets and may refuse to work with substances for which information has not been provided and may not be discharged or otherwise disciplined for requesting information, taking part in any proceeding, or exercising any right under the act.

The Alabama Mining Academy was created. Its purpose will be to assist in the safety and health training of the State's miners, to cooperate with and provide assistance to the State mining industry in developing effective mine health and safety programs, and to improve and expand research and development and training programs aimed at developing a safer, more productive coal industry.

The board of examiners, which certifies competency of certain mine personnel, previously scheduled for termination October 1, 1984 was extended indefinitely and it gained two members.

Employment and training. A joint resolution urged the U.S. Congress to retain the Work Incentive Program and provide a reasonable level of funding for it consistent with program needs and responsibilities for helping recipients of Aid to Dependent Children become wage earners.

Alaska

Equal employment opportunity. The Office of Equal Employment Opportunity was established in the Office of the Governor to administer the equal employment opportunity program for the executive branch of State government and to ensure compliance with affirmative action responsibilities.

Other laws. The Superior Court has invalidated the law requiring preferential hiring of residents from Alaska on public works projects let by the State or a political subdivision. The decision is on appeal to the State Supreme Court. In conjunction with this case, a series of legislative findings were retroactively enacted presenting the legislature's rationale for having established resident preference. The legislature additionally declared its policy that it will grant employment preference to residents when the State is acting as a market participant.

Arizona

Child labor. The general prohibition against employment of children under age 16 after 9:30 p.m. was amended to bar their employment after 7 p.m. in door-to-door sales or deliveries, except for home newspaper delivery.

Equal employment opportunity. The State's antidiscrimination law was extended to protect physically handicapped persons from employment discrimination. In addition, it was made an unlawful employment practice for an employer, labor organization, or employment agency to fail or refuse to reasonably accommodate an individual's handicap.

Background clearance. As a condition of employment, juvenile probation officers, school personnel, day care center personnel, child care personnel, State department of corrections personnel working where youth offenders are confined, day care homes personnel, and recipients of Federal child-care food program monies are now required to submit fingerprints and a statement that they have not been convicted or are not awaiting trial for committing certain specified criminal offenses including the sexual or other abuse of minors.

A separate law now permits employers and potential employers to obtain criminal history record information concerning convictions for sexual offenses and prostitution involving minors under age 15, sexual exploitation of children, and child abuse, for employees or applicants for employment involving regular contact with minors under age 15.

Industrial homework. With specific reference to attempts to stop the home employment of telecommuters, a Concurrent Memorial was adopted asking the President, the Congress, and the U.S. Secretary of Labor to take any action necessary to rescind existing orders and regulations prohibiting commercial homework and to refrain from extending these prohibitions to additional categories of activities.

Other laws. It is now a prohibited personnel practice for public employees who have control over personnel actions to take reprisals against employees who disclose to a public body, information which they reasonably believe evidences a violation of any law or mismanagement, provided the information is not disclosed in a manner prohibited by law or the materials or information has not been deemed confidential by law.

Arkansas

Wages. As provided in a prior law, the minimum wage rate was increased from $3.05 to $3.15 an hour effective January 1, 1985.

Occupational safety and health. An amendment to the law regulating the inspection of boilers permits continuous monitoring of certain boilers by mechanical or electronic devices approved by the Director of the State Department of Labor as an alternative to hourly checking.

Employment and training. The role and function of the Arkansas Industry Training Program were expanded to authorize provision of training for employees of existing business and industry in order to encourage industrial and economic development of the State by upgrading skills and abilities needed to operate more modern and sophisticated equipment and procedures.

An Arkansas Advisory Council on Vocational-Technical Education was created, to be appointed by the Governor. Among its duties are promoting interest in vocational and technical education, assisting in the development of plans required under the Federal vocational education law, evaluating vocational program delivery systems under that law and the Federal Job Training Partnership Act, making recommendations on the adequacy and effectiveness of coordination between vocational education and the Federal act, and advising various Federal and State officials of any findings.

A Riverside Vocational Technical School was established to provide vocational technical training for prison inmates, with administration by the State Board of Vocational Education in cooperation with the Department of Corrections.

California

Wages. Townships were eliminated from the definition of political subdivision for purposes for coverage under the State prevailing wage law.

On September 6, 1985 the Ninth Circuit U.S. Court of Appeals reversed and remanded a District Court decision which had held that the Federal Employee Retirement Income Security Act of 1974 (ERISA) preempts a California statute barring forfeiture of vacation pay and requiring payment of a pro rata share of such pay on the employee's termination. In effect the appellate decision upheld the U.S. Department of Labor's regulation that a practice of vacation pay paid out of general assets does not constitute an "employee benefit plan" subject to ERISA.

Hours. A statutory sunset date of January 1, 1986 was repealed which would have terminated the authority of the Chief of the Division of Labor Standards Enforcement to exempt any employer or employees from any mandatory day or days off requirement contained in any order of the Industrial Welfare Commission.

Agriculture. Commercial packing houses engaged in both the harvesting and packing of citrus fruit or soft fruit for a client or customer will not be included within the definition of farm labor contractor for purposes of coverage under the Farm Labor Contractors' Act.

Coverage of the law requiring minimum health standards in farm labor camps was expanded to provide for the licensing and inspection of more of such camps, and additional protections against evictions of tenants who complain about substandard conditions were adopted.

Equal employment opportunity. It will now be an unlawful employment practice for an employer to discriminate against an employee because of a conflict between the employee's religious observance and any employment requirement, unless the religious observance cannot be reasonably accommodated after exploring all available means. Employees must be given the option of making up work time lost because of religious observance if there is no undue hardship on the employer, or of taking paid or unpaid leave.

A loan guarantee program administered by the Department of Rehabilitation was established to assist employers and employees with disabilities to purchase equipment, aids, and assistive devices in order to engage in employment, or for supported employment for persons with disabilities who are unable to engage in competitive employment and who are not eligible for vocational rehabilitation.

The U.S. Supreme Court ruled in the case of *Atascadero State Hospital and California Department of Mental Health, Petitioners vs. Douglas James Scanlon* that receipt of Federal funds does not in itself constitute a waiver of a State's Eleventh Amendment immunity to suit in a Federal Court for alleged violations of the Rehabilitation Act of 1973.

Background clearance. Among changes to the laws relating to child abuse, the Department of Social Services must request from the Department of Justice any reports of child abuse concerning applicants for licensure or employment in a position having supervisory or disciplinary power over children or who will provide 24-hour care for children in a residential home or facility.

Occupational safety and health. Starting January 1, 1987, any contractor whose operations include asbestos-related work involving 100 square feet or more of asbestos-containing materials must have passed an asbestos certification examination to be developed by the Contractors

State License Board, and must register with the labor department's Division of Industrial Safety. Civil and criminal penalties were established for operating without the certificate or for contracting with an uncertified person. Employers are to train employees, provide necessary equipment to do the work safely, report on asbestos work to be done, and provide health insurance coverage to cover the cost of medical examinations and required monitoring.

Additional circumstances under which the Division of Occupational Safety and Health may issue a "notice" in lieu of a citation will now include violations that do not have an immediate relationship to the health or safety of an employee, and are of a general or regulatory nature, and the employer agrees to correct the violations within a reasonable time and not to appeal the findings of violation.

The Occupational Carcinogens Control Act was moved from the Health and Safety Code to the Labor Code, and civil penalties for serious or repeated violations were substantially increased.

In addition to those materials on the Director of Industrial Relations' list of hazardous substances, any substance within the scope of the Federal Hazard Communication Standard will be considered hazardous under the State Hazardous Substances Information and Training Act. Manufacturers, importers, and distributors of hazardous substances, and employers, must label each container of such material in a manner consistent with Federal standards.

The Department of Health Services must establish, no later than January 1, 1987, the program on occupational health and occupational disease prevention that the legislature previously directed the Department to maintain. The Department is authorized to enter places of employment to conduct investigations relating to the program, and employers must provide certain monitoring data to the Department.

Other laws. Contractors awarded a contract in excess of $5,000 for any public works construction by a State office, department, division, bureau, board, or commission shall, before beginning the work, file a payment bond with the awarding agency. A $25,000 threshold amount remains in effect for a required payment bond for contracts let by all other public entities.

Complaints that an employee has been discharged or otherwise discriminated against because the employee has filed a complaint or claim or instituted proceedings relating to rights which are under the jurisdiction of the labor commissioner, will be investigated by a discrimination complaint investigator instead of by the Division of Labor Standards. Procedures for such investigations were established including the holding of investigative hearings and the issuance and enforcement of cease and desist orders in cases of violation.

Colorado

Wages. The State prevailing wage law was repealed over the Governor's veto.

Other laws. Resident bidders on State or local public works projects will now be entitled to a preference over out-of-State or foreign bidders, equal to the resident preference given to such bidders by their own State or country, except when this preference would cause the denial of Federal moneys or would otherwise be inconsistent with requirements of Federal law.

Connecticut

Wages. The minimum project dollar amount for coverage under the prevailing wage law was increased from $50,000 to $200,000 for new public works construction and from $10,000 to $50,000 for alteration or repair. Also, upon award of a covered contract, the contractor is now obligated to certify under oath to the labor commissioner the pay scale to be used by the contractor and any of his subcontractors.

Child labor. Provisions limiting the permissible daily, weekly, and night work hours of minors under age 18 will no longer apply to those who have graduated from secondary school.

Labor relations. The legislative joint standing committee on labor and public employees is to conduct a study of municipal collective bargaining and binding arbitration including issues such as composition of bargaining units, employees to be covered under collective bargaining, impasse procedures, and the right to strike. The committee is to report its findings and any recommendations for legislation to the general assembly by January 31, 1986.

Plant closings. Employers of 100 or more who close or relocate their establishments must now pay for the continuation of existing group health insurance for each affected employee and dependents for up to 120 days, rather than 90 days as before.

Other laws. Private and public sector employers of 26 employees or more may not require as a condition of employment any employee or job applicant to execute an employment promissory note obligating the employee to pay a sum of money to the employer if the worker leaves the job before a stated period of time. Such a barred note includes any agreement which specifies that the payment constitutes reimbursement for training previously provided.

Employees of public service companies or of their suppliers may now disclose any information involving substantial mismanagement of the company to the Department of Public Utility Control without fear of retaliatory action taken or threatened against them. In addition, the law protecting employees from discharge or discipline for disclosing to public agencies of the State a violation of law by the employer was amended to also cover State employees and to protect disclosure to Federal agencies.

The labor commissioner was directed to establish in the labor department the position of Statewide Coordinator of Services for Displaced Homemakers within the existing displaced homemakers program.

The law requiring employers providing group life, hospital, or medical insurance coverage to furnish each insured employee with notice, within 15 days, of the cancellation or discontinuation of such insurance, and prescribing fines for violation was amended to specify that the labor commissioner has the authority to assess all such fines.

Delaware

Employment and training. An extended workshop employment program was established for severely disabled persons who have completed an accredited program of evaluation and work adjustment training and have been found to be incapable of competitive employment because of the nature and severity of their disability. The program is to be administered by the Department of Labor which is authorized to contract with sheltered workshops to provide the program.

Other laws. A new "Police Bill of Rights" deals with the rights of police officers with respect to the conduct of administrative investigations of them, the insertion of adverse material in the officers' personnel files, and the right to engage in political activity while off-duty. Assignment to work extra duty without compensation as a penalty for a disciplinary infraction was prohibited.

District of Columbia

Wages. A revised wage order, applicable to manufacturing, printing, publishing, and wholesale trade occupations, increased the minimum wage from $3.50 to $3.95 an hour effective August 20, 1985. A minimum rate of $3.70 an hour may be paid to adult learners for not more than 60 days.

Equal employment opportunity. The Pregnancy Anti-Discrimination Act of 1985 amends the Human Rights Act to specify that discrimination on the basis of sex shall include, but not be limited to, discrimination on the basis of pregnancy, childbirth, or related medical conditions. Women with these conditions are to be treated the same for all employment-related purposes, including receipt of benefits under fringe benefit programs, as other persons not so affected but similar in their ability or inability to work.

Florida

Agriculture. The reach of the Farm Labor Registration Law was extended by applying it to contractors with one farm worker or more instead of 10 or more as before. The renewal date for registrations was changed from December 31 for all contractors, to the birthdate or date of incorporation of the registrant, thereby coinciding with registration renewal under the Federal Migrant and Seasonal Agricultural Worker Protection Act. Civil penalties of up to $1,000 may now be assessed for violations of the law or rules, and the Divison of Labor, Employment, and Training may obtain injunctive relief against unregistered contractors.

Background clearance. Extensive amendments, relating to employment in services providing child care and care of the developmentally disabled and others, establish conditions for disqualification from employment because of past criminal activity. Other requirements include security background investigations, fingerprinting, and conformance with standards of good moral character.

Occupational safety and health. The Department of Environmental Regulation was directed to collect, compile, and correlate information necessary to assess the risk potential in the State from the accidental release of toxic or otherwise hazardous substances into the environment. The information is to be gathered from producers, users, transporters, and storers of such substances and is to be disseminated to appropriate State and local agencies, along with the names of contact persons who can be reached in an emergency.

Other laws. Payment bond requirements now permit public work contracts with any county, city, or political subdivision, amounting to $200,000 or less, to be exempted from payment and performance bond requirements. Also, any person entering into such a contract with the State for $100,000 or less will be exempted, and those with contracts, amounting to more than $100,00 but less than $200,000, may be exempted from such bond requirements.

Georgia

Worker privacy. Among several amendments to the law relating to the regulation and licensure of polygraph examiners, procedures were established for administering tests, and examiners are now prohibited from inquiring, during preemployment or periodic employment examinations, into such areas as religious or political beliefs or affiliations, racial matters, sexual preferences or activities, or beliefs or activities regarding labor organizations. Persons examined will now have the right to sue an examiner for damages resulting from improper or negligent testing.

Background clearance. Among changes to the law requiring criminal records checks for directors and employees of day care centers, homes, or institutions that care for children, applications for preliminary records checks must be submitted prior to employment, and 10-year prior employment history records of employees must be on file.

Private employment agencies. The State Employment Agency Advisory Council, scheduled for termination on July 1, 1985, was extended to July 1, 1986.

Occupatonal safety and health. A new safety law regulating amusement ride safety was enacted to be administered by the Department of Labor. The Department is authorized to formulate standards and regulations for the safe assembly, disassembly, repair, maintenance, use, operation, and inspection of amusement rides. Ride owners must obtain a permit for each ride, and the rides must be inspected at least annually. A minimum age of 16 was established for the operator of an amusement ride.

Amendments to the boiler and pressure vessel safety law transfer the power of appointment to the Board of Boiler and Pressure Vessel Rules from the Governor to the Commissioner of Labor, give rulemaking power, previously with the Board alone, to the labor department with the Board's advice, and exempt from coverage boilers and pressure vessels operated and maintained by public utilities.

Employment and training. By resolution, a House Teenage and Youth Unemployment Study Committee was created to study the problem of teenage and youth unemployment and investigate what State actions may be taken to address this problem.

Other laws. Amendments to the State's labor law eliminated specific statutory references to the Labor Departments' Correctional Services Division and to the Employment Security Agency and its director and substituted references to the parent Department of Labor, where the functions remain.

Guam

Other laws. As of June 18, 1984, the U.S. Immigration and Naturalization Service, by rule, transferred from the U.S. Secretary of Labor to the Governor of Guam the authority to make determinations on temporary labor certifications for the importation to Guam of nonimmigrant alien workers and required the Governor to develop systems for determining availability of U.S. workers and prevailing wage rates, subject to approval by the Commissioner of the U.S. Immigration and Naturalization Service. Subsequently, by publication in the Federal Register on January 4, 1985, operating policies and procedures for implementing the Governor's authority were established. Administratively, the program is operated by the Guam Department of Labor.

Hawaii

Wages. It was made an unlawful discriminatory practice under the State's Fair Employment Practice Law for an employee to refuse to hire, employ, bar, or discharge from employment any individual because of a wage assigament to satisfy a child support obligation.

A House resolution was adopted requesting that all employers recognize and adopt the concept of equal pay for work of comparable value to their organizations.

Worker privacy. A comprehensive law was enacted continuing a prohibition against employer use of lie detector tests as a condition of employment or continued employment. The new law, covering employees and prospective employees, includes specific administrative and enforcement provisions, under the jurisdiction of the Department of Labor and Industrial Relations, which has rulemaking authority. The Department is directed to investigate complaints and issue cease orders and may order remedies such as hiring or reinstatement, with or without backpay. Class action complaints may be filed by the Department or the Attorney General. Employers who discharge or otherwise discriminate against employees or prospective employees for refusing to submit to the test or for filing a complaint or who otherwise violate the law may be subject to civil and criminal penalties.

Background clearance. Directors, employees, and staff members of child caring institutions, child placing organizations, foster boarding homes, and youth correctional facilities will now be subject to a criminal history record check obtained by the Department of Social Services and Housing through the Hawaii Criminal Justice Data Center. In addition, employees of detection facilities will be subject to the same record check obtained by the Judiciary through the Data Center.

Private employment agencies. Among changes to the employment agency regulatory law, agencies are prohibited from requiring employers to withhold placement fees from employee's earnings unless requested or authorized in writing by the employee. Applicants for an agency license no longer must pass a certified employment consultant examination if a licensed principal agent is employed to manage the agency, licenses are renewable on a biennial rather than annual basis, and failure to maintain the required surety bond in full will now result in the automatic suspension of the agency license.

Occupational safety and health. A resolution was adopted encouraging the Occupational Safety and Health Division of the State Department of Labor and Industrial Relations to develop specific programs to inform employees about the State's right-to-know rules on toxic materials and harmful agents in the workplace.

The State fire council was placed within the Department of Labor and Industrial Relations for administrative purposes.

Other laws. A Senate Resolution was adopted requesting the Department of Labor and Industrial Relations, with the assistance of the Office of Collective Bargaining, to study the feasibility and appropriateness of statutorily authorizing working parents to take up to 6 months of unpaid vacation leave for parenting purposes, including the impact, if any, of such legislation on the State's collective bargaining laws.

Idaho

Wages. The State prevailing wage law and the public work 8-hour day law were repealed.

Employees may now, by revocable authorization, have wages directly deposited in any bank, savings and loan association, or credit union of their choice in the State.

Upon application of a creditor, courts will now issue a continuing garnishment of wages to remain in effect until the judgment is satisfied.

Hours. The 8-hour a day limit on work in all mines and smelters, except in emergencies, was amended to retain the 8-hour limit for underground mines, but to now permit work up to 10 hours a day in surface mines and in smelters at the regular hourly rate of pay. Work beyond 10 hours a day may not be required except in emergency situations. Work beyond 10 hours a day or 40 hours a week will be considered overtime and paid at time and one-half the regular rate.

Labor relations. A "right-to-work" law was enacted, specifying that membership in or financial support of a labor organization may not be required as a condition of employment or of continuation of employment. However, a court injunction has deferred enforcement until the measure is voted on as a referendum item at the November 1986 general election.

Other laws. A separate provision requiring seating for female employees was repealed.

Illinois

Wages. By prior law, the minimum wage rate rose from $3 to $3.35 an hour, on July 1, 1985. For minors under age 18, the rate increased to $2.85 on that date.

The wage payment and collection act, which previously exempted all public employees from coverage, was amended to now include employees of local governments and school districts. Employees of the State or Federal governments remain exempt.

Any wages collected by the Department of Labor under the minimum wage law, which cannot be paid to the affected employees, will be deposited into the State's General Revenue Fund after 1 year, instead of being returned to the employer as was the prior practice.

On August 12, 1985, a State Appellate Court affirmed a Circuit Court's judgment dismissing the Director of the Department of Labor's complaint for injunctive relief in a case involving a provision of the State constitution permitting municipalities of populations over 25,000, and any county which elects a chief executive officer to become home-rule units by referendum and to exclude themselves from coverage of certain State statutes. This action permits these home-rule units to continue to exempt themselves from coverage of the State prevailing wage law. An appeal has been filed with the State Supreme Court.

Child labor. City or Regional Superintendents of Schools were authorized to issue employment certificates for minors under age 16, permitting them to appear as models or in motion picture, radio, or television productions, if such work does not interfere with required school attendance. The Department of Labor is to issue rules and regulations to protect the health and welfare of child models or actors, and to ensure that the conditions under which they are employed will not impair their health, welfare, development, or proper education. Similar employment certificates were previously authorized for minors under age 16 for appearances in theatrical productions, musical recitals, or concerts.

Equal employment opportunity. The Departments of Employment Security and Rehabilitation Services are to cooperate and to enter into any necessary agreements to provide job placement and referral services to disabled clients of the Department of Rehabilitation including job service registration of such clients with Illinois Employment Security Offices and making available to them job listings maintained by the Department of Employment Security.

Worker privacy. The 1984 law giving private and public sector employees the right to review their personnel records was amended to provide for administration by the Director of Labor instead of only by employee-instituted court action. The Director is authorized to take complaints, conduct investigations, attempt to resolve the complaint by conciliation, and to commence legal action, if necessary. Private right of action is still authorized when these measures fail, and employer retaliation against an employee, who makes a complaint, brings action, or testifies under the law, is now prohibited.

Background clearance. The Department of Children and Family Services will now require that child-care facility license applicants and their employees be investigated as a condition of licensure or employment to ascertain past charges or convictions for criminal sexual or child assault or abuse. The operator of a licensed child-care facility will now have access to all records concerning reports of child abuse and neglect and all reports generated as a result of such reports when a current or prospective employee is the perpetrator in a child abuse or neglect report.

Labor relations. A Labor Management Cooperation Committee was created in the

Department of Commerce and Community Affairs consisting of 12 public members appointed by the Governor, six of them to represent businesses that employ union members and six representing labor, plus six ex officio members including the Director of the Department of Labor. Among its duties, the committee is to improve communications between labor and management on significant economic problems facing the State; encourage and support the development of local labor-management committees at the plant, industry, and area levels; and convene a Statewide conference on labor-management concerns at least once every 2 years. The Director of the Department of Commerce and Community Affairs, with the advice of the Committee, was authorized to provide matching grants and other resources to establish or assist area labor-management committees and other projects which serve to enhance labor-management relations.

The Department of Labor, upon written request of all parties involved, is to provide arbitration services necessary to resolve labor-management disputes. The proceedings are to be subject to the Uniform Arbitration Act.

Unfair labor practice charges under the State Educational Labor Relations Act may now be filed with the Illinois Educational Labor Relations Board by individuals as well as by employers or labor organizations as was previously authorized.

In an effort to avoid strikes in local school districts, a house resolution urges educational employee labor organizations and educational employers of primary and secondary schools to begin renegotiations for their collective bargaining agreements by January 1 of the year in which the agreement expires or at least 6 months before the expiration of their existing agreements.

Occupational safety and health. Beginning July 1, 1986 under a new Illinois Chemical Safety Act to be enforced by the State Environmental Protection Agency, specified businesses must have a written chemical safety contingency plan including a listing of chemical substances which may be released at the facility, information on the probable nature and routes of any sudden releases, response procedures to be followed at the facility and for notifying local emergency response agencies, a list of appropriate persons to act as emergency coordinator, and a list of the facility's emergency equipment. Plant personnel who are responsible for implementing the plan must be trained in the procedures to be followed in case of an accidental release of a chemical substance. After submission to local fire, police, or other emergency response agency, such plans are to be made available for inspection by the public during normal operating hours.

Employment and training. A law was enacted implementing an April 1, 1984 Executive Order creating a separate Department of Employment Security. The Department assumes all powers and duties of the Department of Labor's former Bureau of Employment Security, now abolished. Among its functions, the Department of Employment Security will manage vocational training and retraining programs for the unemployed, State welfare recipients, Vietnam veterans, and the handicapped.

An emergency employment development act was passed under which funds for temporary work relief projects in nonprofit agencies and new job creation in the private sector are to be allocated on the basis of the highest average percentage of unemployed persons within the Job Training Partnership Act delivery area. The funds are to be used as a contribution for wages and fringe benefits in the employment of qualified unemployed workers. Participating businesses must be in compliance with applicable affirmative action, fair labor, health, safety, and environmental standards.

A joint resolution was adopted urging the U.S. Congress to amend the Veterans Educational Assistance Act of 1984 to include apprenticeship and on-the-job training programs.

Indiana

School attendance. The Department of Education is to study the impact of raising the compulsory school attendance age from 16 to 17 and deliver the results to the general assembly by November 1, 1986. The Department is also to prepare a plan incorporating new programs or curriculum changes in order to accommodate the increased number of students and their interests and abilities.

Employment and training. An Indiana Occupational Information Coordinating Committee was established to develop and implement a comprehensive cost effective labor market and occupational information system that, among other functions, will satisfy the needs of State and local employment, training, vocational education and rehabilitation, and economic development agencies.

Other laws. The title of the Division of Labor was changed to the Department of Labor. Prior to this change a Department of Labor existed consisting of the Industrial Board of Indiana and the Division of Labor, two bodies with complete autonomy and separate functions. The Industrial Board will retain that title.

Iowa

Wages. Individuals employed as commission-paid salespersons are now specifically covered by the wage payment/collection law. Also, the exemption from this law for licensed persons employed on a contractual basis for professional services was removed.

Procedures were established for State employees to request a review of the factor determined scores of their jobs under the newly implemented pay grade system based on comparable worth. An interim legislative study committee is to be established to determine whether discrimination remains in compensation for work of comparable worth between jobs held predominantly by women and those held predominantly by men and to review other comparable worth issues.

Equal employment opportunity. "The Bill of Rights of Persons with Mental Retardation, Developmental Disabilities, or Chronic Mental Illnesses" was enacted, including a right to vocational training and a requirement that such persons engaged in work programs shall be paid wages commensurate with the going rate for comparable work and productivity.

Background clearance. Directors and employees of any State-licensed child care center, registered group home, or registered family day care home will now be subject to a criminal records check and a child abuse registry check through the Department of Human Services. The Department will maintain and make public a list of centers and homes with favorable records checks.

Labor relations. Collective bargaining negotiations with certified employee organizations representing Judicial Department employees will now be conducted on a Statewide basis rather than by judicial district, although bargaining units will be organized by judicial district.

A concurrent resolution was adopted directing the legislative council to establish a study committee to conduct a comprehensive study of the collective bargaining process as it relates to elementary and secondary school educators, with a report due by November 1, 1985.

Employment and training. A Small Business New Jobs Training Act was enacted to create jobs by providing education and training of workers for new jobs for new or expanding small businesses through training arrangements between area schools and employers. The program, to be coordinated by the Iowa Development Commission, will give preference to any skilled workers in the community who are unemployed because of plant closing or layoffs.

Other laws. The labor commissioner's term of office will be lengthened from 2 to 4 years effective May 1, 1987.

All public employees are now protected against retaliatory personnel actions for providing information to legislators or public officials or for disclosing waste, mismanagement, violations of law, or violations endangering public health or safety unless such disclosure is prohibited by statute.

Kansas

Labor relations. A House Resolution was adopted commending Idaho for passing "right-to-work" legislation.

Other laws. The life of the Department of Human Resources was extended until 1993. The Secretary of the Department was given more direct administrative control over the Division of Employment Security, the Division of Labor-Management Relations and Employment Standards, including the Agricultural Labor Relations Board and the Public Employee Relations Board, and the Division of Employment and Training. The Secretary, along with the State Board of Education, was authorized to participate in programs funded by the Federal Job Training Partnership Act.

Louisiana

Wages. A bill which would have repealed the prevailing wage law passed the legislature but was vetoed by the Governor.

Undocumented workers. The law prohibiting the employment, recruiting, or referral for employment of undocumented alien workers, was amended to bar prosecution of employers who have been furnished specified documents by all of their alien workers. The Secretary of the Department of Labor is now authorized to assess civil penalties for violations of the Act, and to institute civil court proceedings including the seeking of injunctive relief to restrain and prevent violations.

Equal employment opportunity. Coverage of the law prohibiting discrimination in employment because of age was expanded to include employers subject to the Federal Age Discrimination in Employment Act.

The definition of impairment under the Civil Rights for the Handicapped Act was expanded to include persons with a prior mental disorder or condition.

An Office of Women's Services was established within the office of the Governor. Among its duties are assistance in coordinating State programs serving the needs of women and providing technical assistance to the Governor's commission for women. The office will assume some functions previously allocated to the Department of Health and Human Resources including administration of the displaced homemakers act. It is also to develop nontraditional job training programs for women, particularly geared to economic self-sufficiency and to women with low incomes.

Occupational safety and health. A Hazardous Material Information Development, Preparedness, and Response Act was adopted to create a comprehensive information system containing specific data regarding the presence and location of hazardous materials in the State. An interagency advisory board was created in the office of the Deputy Secretary of the Department of Public Safety and Corrections to make recommendations regarding survey forms, hazardous materials, information dissemination, training, and emergency response plans. Among other provisions, owners or operators must file survey forms with the Department for all hazardous materials manufactured, used, or stored at their facilities and for emissions and must post signs at their facilities indicating that a hazardous material is present on the premises; employees are to be given information on the toxic effects of hazardous materials manufactured, used, or emitted at the facility; procedures were included for the release of trade secret information in emergency situations; and administrative fines may be levied owners and operators who knowingly fail to report required information. The law exempts single business establishments with no more than nine employees and no more than 2 million dollars in average annual gross sales, as well as certain specified retail establishments. Also, local governing authorities are preempted from enacting any ordinance in conflict with the act or which requires more onerous reporting requirements.

Maine

Wages. By prior law, the minimum wage rate rose from $3.35 to $3.45 an hour, effective January 1, 1985. Further increases to $3.55 on January 1, 1986, and to $3.65 on January 1, 1987, are scheduled.

Automobile mechanics not paid on an hourly basis and automobile salespersons were exempted from overtime pay requirements of the State minimum wage law.

An Executive Order was issued in response to the U.S. Supreme Court ruling that State and local governments are liable for overtime payments for their workers under the Fair Labor Standards Act. Under the order, all nonstandard employees who are not eligible for exemption from the Act are to comply with specified hours limitations, emergency scheduling and other procedures to ensure that the total number of hours they work does not incur Federal overtime liability beyond the State's budgeted, authorized ability to pay.

Hours. Employees will not be entitled to at least a half hour for rest time or mealtime after 6 consecutive hours of work, except in emergency situations, unless a collective bargaining or other written employer-employee agreement provides otherwise. Employers are prohibited from discharging or discriminating against employees who file complaints with the Director of the Bureau of Labor Standards or the Attorney General and face possible civil penalties for violation. The law does not apply where fewer than three employees are on duty at a time and where the nature of the work allows frequent breaks during the day.

Equal employment opportunity. The nondiscrimination and affirmative action provisions applicable to State agencies, State-financed agencies, and public contracts were extended to uniformly protect persons who are physically or mentally handicapped, either by covering both types of handicap or by adding the mentally handicapped to the previously covered physically handicapped. In addition, agency equal opportunity officers were renamed affirmative action officers and the Equal Opportunity Specialist in the State Department of Personnel was retitled the State Affirmative Action Coordinator.

A Division of Deafness was created within the Department of Human Services' Bureau of Rehabilitation. Among its power and duties is the duty to provide advocacy for the rights of the deaf and hearing impaired in employment, education, and other areas.

Occupational safety and health. A Community Right-to-Know Act was approved under which the Department of Human Services was directed to establish a community health information clearinghouse on hazardous chemicals in use in the home and the workplace, and was mandated to respond to information requests from State agencies, municipalities, and individuals.

The Commissioner of Labor is to conduct a study of the occupational health and safety conditions to which railroad employees are subject and is to report to the legislature on the result of these findings, on efforts by any Federal or State agency to establish standards for railroad employers, and on the need for State standards, with recommendations for legislation if necessary.

Plant closings. The Department of Labor is now authorized to administer and operate a program of Trade Adjustment Assistance, as provided under the U.S. Trade Act of 1974 (P.L.93–618), to provide training and supportive services for workers displaced from employment because of increased foreign imports.

Employment and training. The Maine Conservation Corps Program due to expire at the end of fiscal year 1985 was continued and amended to, among other things, specify the types of projects that may be undertaken and to establish a volunteer program within the Corps to create, promote, and manage volunteer and intern opportunities with public agencies responsible for the State's natural resources.

Other laws. The law prohibiting employers from requiring employees or accepted job applicants to pay for required medical examinations was amended to specifically include employer-required eye examinations.

Employees of public utilities now have the right to testify on their own time before legislative committees and the Public Utilities Commission regarding the operation of the utility and may not be discharged, threatened, or otherwise discriminated against if the employee has first brought the subject matter or the testimony to the attention of his or her supervisor in writing. False testimony, testimony which violates a collective bargaining agreement, or testimony which discloses trade secrets or corporate strategy that would result in harm to the employer automatically terminates the protection from discharge or discrimination. State employees were also given the right to testify before legislative committees on their own time, with the same protection from retaliation.

Under the "Workplace Smoking Act of 1985," effective January 1, 1986, public and private sector employers will be required to establish, post, and implement written policies restricting or banning smoking in the workplace. The Bureau of Health is responsible for enforcement, and fines of up to $100 may be levied for noncompliance. In addition, it will be unlawful for employers to retaliate, discipline, discharge, or otherwise discriminate against employees who assist in the supervision or enforcement of the law.

Maryland

Wages. Coverage of the wage-hour law was extended to employees of legitimate theaters, by removal of a former exemption, but the exemption continues for employees in motion picture and drive-in theaters. Also, notwithstanding the fact that the law's overtime pay standard does not apply to employees in seasonal or recreational establishments, it was specifically required that time and one-half overtime pay after 40 hours a week be paid to theater craft or trade employees of a concert promoter, music pavilion, legitimate theater, music festival, or theatrical show, other than a nonprofit employer.

On written request of a State employee, organization dues of qualifying organizations will be withheld from his or her wages and remitted to the designated organization. The employee may cancel the payroll deduction at any time.

Equal employment opportunity. By repeal of the June 30, 1985 expiration date, a previously authorized program remains in effect permitting State employees over age 70 to continue employment on a year-to-year basis upon written application and approval, and permitting persons age 70 and over to compete for merit system positions but without being eligible to participate in the State pension system.

Occupational safety and health. The law requiring employers to inform employees of and to train them on toxic substances in the workplace was amended to delete an exception from the law for ingredients used in the production of food stuffs regulated by Federal law, and to exempt from the labeling requirement certain other substances that must be labeled in accordance with other Federal law or regulation.

The Department of Health and Mental Hygiene must consult with the Division of Labor and Industry when the Department adopts rules and regulations to provide public access to information the Department had concerning hazardous or toxic chemicals on hazardous chemical information lists and material safety data sheets. Such information is to be submitted by employers and is to be made available, upon written request, to environmental, civic, or consumer organizations and to individuals living near a business that stores, produces, or locates hazardous or toxic chemicals.

Plant closings. The Secretary of Employment and Training in cooperation with the Governor's Employment and Training Council was directed to develop voluntary guidelines for employers faced with a closing, relocation, or reduction in operations. The guidelines are to include appropriate advance notification to employees, continuation of employee benefits, and mechanisms for employers to use the State's newly created Quick Response Program. This program includes on-site registration for unemployment insurance claims, registration for Federal Trade Readjustment Act services if appropriate, provision of labor market and retraining information, job placement services and information, and retraining referrals. The Department of Employment and Training is to distribute the guidelines to all employers biennially and is to monitor layoffs and employment patterns to identify potential reductions.

Employment and training. The Secretary of Employment and Training may provide grants to private industry councils or administrative entities designated under the Federal Job Training Partnershp Act for operation, in the private sector, of a youth work experience program for specified economically disadvantaged high school juniors and seniors and high school dropouts. Currently employed workers are not to be displaced by those participating under this youth program.

Massachusetts

Equal employment opportunity. The exception from the ban on compulsory retirement for persons aged 65 and over who are employed in executive or high policymaking positions, was amended to except those entitled to an immediate annual retirement benefit of at least $44,000 rather than $27,000, as was previously permitted.

Labor relations. Impasse procedure provisions for both private and public sector labor disputes were amended to provide that any person acting as a mediator who receives information, as a mediator, relating to a labor dispute will not be required to reveal such information in any administrative, civil, or arbitration proceeding.

Other laws. The authority of the labor commissioner to suspend various labor laws, when an emergency exists or there are conditions of hardship in an industry or establishment, was extended to July 1, 1990.

Michigan

Employment and training. The Michigan Youth Corps Act scheduled to expire September 30, 1984, was extended 2 more years to September 30, 1986. The Act provides summer employment and work training for youth.

Minnesota

Employment and training. A Department of Jobs and Training was created, headed by a commissioner, to streamline and coordinate the State's employment, training, and income maintenance programs. The new department will assume both new functions and certain functions previously performed elsewhere in State government, such as by the Department of Human Services and the Department of Economic Security, the latter now dissolved. Responsibilities include the providing of consistent, integrated employment and training services across the State, administering the unemployment insurance laws and public employment offices, and acting as the Governor's agent in administering the Federal Job Training Partnership Act. Also, a Governor-appointed Coordinator of Full Productivity and Opportunity will, among other duties, coordinate the policies and administration of employment and training programs and income maintenance and support services among State agencies. The Commissioner of Labor and Industry, like other State officials who are to submit plans, is to prepare a plan for preparing, recruiting, and placing economically disadvantaged, chronically unemployed, minority, and female individuals in apprenticeship programs and submit the plan to the Coordinator in each even-numbered year, for use in developing a biennial Statewide employment and training plan.

Mississippi

Labor relations. Included in a tax revenue bill is a provision which sets increased minimum salary scales for teachers and other provisions making strikes unlawful by public employees generally, and specifically by public school teachers. Individual violators may be dismissed; employee organizations violating an injunction against a strike face fines of up to $20,000 a day; and members of local school governing boards or public school administrators face penalties for failure to fulfill certain responsibilities in the event of a strike.

Other laws. The law providing a preference for resident contractors in the letting of public contracts was amended to specify that resident contractors will include those nonresidents qualified to do business in the State who have maintained a permanent, full-time office in the State for 2 years prior to January 1, 1986. No time limit was previously specified.

Missouri

Equal employment opportunity. The Missouri Council on Women's Economic Development and Training was created within the Department of Economic Development to promote and increase women's economic and employment opportunities through education and training programs. The Missouri Commission on the Status of Women was abolished.

Background clearance. The Division of Family Services is now to conduct a criminal record review before issuing a license to enumerated child-care providers or other local or State agencies providing or having care or custody of a child for 20 hours or more per week. No license shall be issued if the provider has committed acts which have been harmful or demonstrated to be of harm to a child, and providers are not to employ any person who has committed such acts.

Occupational safety and health. A new law requires every employer to provide information regarding the properties and hazardous nature of toxic substances used or produced in the workplace to the local fire protection service and the State Division of Health through the submission of material safety data sheets or their equivalent, permitting on-site inspection, and by providing the name, address, and telephone number of at least two individuals familiar with the toxic substance who may be contacted in an emergency. Information provided by employers will be available to the general public, upon request, although provision was made for the confidentiality of trade secret information.

Montana

Wages. The minimum wage was increased from $2.75 to $3.05 an hour effective October 1, 1985, with a further increase to $3.35 scheduled for October 1, 1986.

Notwithstanding the requirement in the State wage-hour law for payment of time-and-one-half after 40 hours worked in a week, local departments of public safety may establish work periods other than a 40-hour workweek, if the hours of all work periods in a year do not exceed 2,080 hours. The overtime pay rate for hours worked in excess of the regularly scheduled work period is to be determined by the board of county commissioners.

A new law specifically authorizes the labor commissioner to adopt rules implementing laws governing prevailing wage rates and preference of State residents in public works construction contracts.

Equal employment opportunity. Mandatory retirement because of age of firefighters and law enforcement personnel including highway patrol officers, police officers, sheriffs, and game wardens, is no longer required under their respective retirement systems.

Private parties, in addition to the Human Rights Commission itself, as before, may now petition the district court to enforce an order of the Commission.

Labor relations. Various arbitration provisions were repealed and replaced by the Uniform Arbitration Act making all arbitration agreements between employers and employees valid and enforceable, subject to certain exceptions, and establishing provisions governing arbitration procedures, awards, and appeals.

Occupational safety and health. A new Employee and Community Hazardous Chemical Information Act establishes a program for the disclosure of information about hazardous substances in the workplace. Employers are to compile and maintain a list of all hazardous chemicals present and the work areas in which they are normally stored or used. Employees have a right to this information and may refuse to work with a substance until it is made available upon request. Employees are also entitled to receive education on the chemicals, training in their safe use, and protective clothing where appropriate. Employees may not be subject to any adverse personnel action because they exercise their rights or testify under the act. In addition, employers must make hazardous chemical information available to the clerk and recorder of the county in which the workplace is located and local fire chiefs are to inspect this information and have the authority to make on-site inspections. Manufacturing employers and distributors regulated by Federal Occupational Safety and Health Administration standards and nonmanufacturing employers who choose to comply with those standards are exempt from the State law except with respect to workplace chemical list, material safety data sheet, emergency and community information, and employee rights provisions.

Economic development. In making loans under the Montana in-State investment fund, preference is to be given to investments that will assist enterprises owned by employees or other State residents in providing new jobs or in preserving existing jobs for State residents or in otherwise contributing to the long-term benefit of the Montana economy.

Other laws. By joint resolution, the legislature requested a study by an interim committee of the employment-at-will rule, and the doctrines of wrongful discharge in violation of public policy and the implied covenant of good faith and fair dealing, including the law and court cases in other States. A report, including alternative approaches to such employment problems, is to be submitted to the next legislature.

The responsibility for determining contractor residency for the purpose of giving preference on public contracts to in-State contractors was transferred from the Department of Revenue to the Department of Commerce. Also, an amendment to the law governing the awarding of public works contracts grants resident bidders a 3 percent preference over out-of-State bidders, or the same preference that out-of-State bidders receive over Montana bidders in their State of residence, whichever is greater. Previously only the 3 percent preference applied.

An absolute preference for resident commercial printing establishments in the award of county printing contracts was amended to require that their bids be no more than 5 pecent higher than the bids of competing nonresident establishments. If no bidder qualifies for the resident preference, the contract is to be awarded to the lowest bidder.

Approval for projects funded under the Montana Economic Development Bond Act, the Montana In-State Investment Act, and the Industrial Development Projects Law will now be contingent upon applicants giving State residents a preference in hiring if their qualifications are substantially equal to those of nonresidents.

State and local government buildings in which seven persons or more are employed must now have reserved smoking and nonsmoking work areas in convenient places.

Nebraska

Equal employment opportunity. The Fair Employment Practices Law was amended to prohibit an employer from discriminating against an employee because he or she has opposed any practice or refused to carry out any action unlawful under State or Federal law.

Labor relations. The law governing collective bargaining rights for most public employees was amended to define and exclude supervisors, except firefighters and police officers, from the same bargaining unit as nonsupervisory employees.

Nevada

Wages. Employers must now pay an employee who resigns or quits any wages due by the earlier of either the employee's regular payday or within 7 days after the resignation. Previously, employers were required to pay such employees within 24 hours.

Among amendments to the wage payment and wage-hour laws, the definitions were enlarged and clarified; employers were specifically forbidden to require employees to work without wages during a trial or break-in period; and employers who knowingly issue wage payment instruments against insufficient funds must now reimburse the employee for any charge incurred due to the insufficiency.

Among amendments to the prevailing wage law, the labor commissioner is now to establish a prevailing wage in each county by use of an annual survey of contractors who have performed work in the county. Also, hearing procedures were changed; persons convicted of violating the law may no longer be awarded any public work contract for 2 years following the conviction; and the minimum project dollar amount for coverage under the law was increased from $20,000 to $100,000.

Hours. The provisions covering maximum hours of work permitted in smelters, open mines, surface workings of underground mines, and plaster and cement mills were repealed. The limit of 8 hours within any 24-hour period for work in underground mines, except in emergencies, was retained.

Equal employment opportunity. Coverage of the law prohibiting employment discrimination by the State and political subdivisions was expanded to include discrimination on the basis of physical, aural, or visual handicap and political affiliation, as well as race, creed, color, national origin, age, or sex, as before.

Worker privacy. Employers, or labor organizations which refer persons for employment, must now allow the employee or person referred, upon request, to inspect nonconfidential records containing information used by the employer or labor organization to determine the qualifications of that employee and any disciplinary action taken against him or her. Copies of these records must be furnished, upon request, to current or former employees who have been or were employed for more than 60 days. Provision was also made for the correction of any inaccurate or incomplete information in the records.

Background clearance. The Bureau of Services for Child Care of the Youth Services Division of the Department of Human Resources is now required to investigate the criminal record of adult persons who own, operate, or are employed by child care facilities. Conviction of any of these persons for specified dangerous crimes including sexual assault or abuse of children may cause the Bureau to deny an application for a license or to suspend or revoke any license that has been issued.

Labor relations. The permissible number and location of pickets during a strike or other dispute is now established by law, and certain practices are prohibited such as picketing on private property without written permission or knowingly to threaten, molest, or assault persons attempting to enter or leave any property, and to block entrances and exits with motor vehicles or by spreading nails, glass, or other objects.

Coverage of the law requiring binding arbitration for collective bargaining disputes involving firefighters, was extended to include police officers for the period from July 1, 1985 to July 1, 1987.

A new measure requires a labor organization to publish and distribute proposed changes in a collective bargaining contract to the members who attend the ratification meeting before the vote is taken.

Local labor organizations were authorized to require that plans which provide health, pension, welfare, or other benefits be administered in Nevada. If a plan is being administered by the national labor organization with whom the local organization is affiliated, the local organization may discontinue its contributions and establish a locally administered plan.

Private employment agencies. Among changes to the employment agency regulatory law, the maximum applicant-paid placement fee was increased from 55 to 65 percent of the first month's gross wages. Agencies must now give the applicant for employment a copy of the contract with the agency at the time it is signed.

Other laws. Employers may not terminate the employment of a member of the Nevada National Guard because he or she is ordered to active service or duty. Any member who believes that employment was terminated in violation of the act may request a hearing before the labor commissioner to determine if the employment was so terminated, and if found to have been illegally terminated will be entitled to immediate reinstatement to his or her position without loss of seniority or benefits, and to receive all lost wages and benefits.

The State law giving veteran reemployment rights was repealed. District attorneys are to provide legal assistance to claimants seeking assistance under the similar Federal law.

New Hampshire

Wages. The State prevailing wage law was repealed.

The provision permitting a youth rate of 75 percent of the applicable minimum wage rate will now apply to persons age 16 or under rather than 17 or under as before.

The wage payment law was amended to add a section requiring that employers, other than counties and municipalities, pay employees who report to work at the request of the employer a minimum of 2 hours' pay at their regular rate. The provision will not be applicable where a good-faith effort is made to notify employees not to report to work.

Labor relations. A committee composed of members of the House and Senate and the labor commissioner or his designee was established to draft proposed legislation for recodification of State laws relating to labor and labor disputes. Legislative proposals are to be submitted to the 1987 regular session of the legislature.

Occupational safety and health. The State occupational safety and health law now applies only to public sector employees. Among other changes, the Commissioner of Labor must inspect a place of employment after receipt of an employee petition, and must issue a stop-work order in case of imminent danger. Employers may petition the Commissioner for a review of an employer's action in retaliating or taking other action against employees exercising their rights under the Act.

The requirement that employers provide seats for female employees was repealed.

New Jersey

Wages. Volunteers working at county or other agricultural fairs, who receive only incidental benefits and who are employed by a nonprofit or religious corporation or association which conducts or participates in the fair, are exempted from State minimum wage and overtime pay requirements.

The maximum amount of an employee wage claim on which the labor commissioner may take collection action was increased from $300 to $2,000. Also, the maximum amount of set-off that can be claimed by a defendant was increased from $200 to $1,000.

In October 1984, the legislature authorized creation of the Task Force on Equitable Compensation to study classification and compensation issues of State employees and to recommend changes to achieve pay equity. In a first interim report, submitted to the Governor, the legislature, and Civil Service Commission on June 1, 1985, the primary recommendation was a pay increase for the four lowest pay ranges as an initial step toward establishing pay equity in State service. An appropriation measure to implement this recommendation was introduced and is being considered by the 1985 legislature. The Task Force will terminate December 1, 1987 or sooner in the absence of timely and appropriate legislative action.

Agriculture. A concurrent resolution extended from March 1, 1985 to August 1, 1985 the deadline for submission of findings and recommendations by the Commission to Study the Employment and Compensation of Agricultural Labor. The Commission was created in 1984 to inquire into the hiring, employment, and compensation of workers in the agricultural sector of the economy.

Equal employment opportunity. Mandatory retirement because of age is now prohibited in the private and public sectors except for public safety employees, certain judges, tenured higher-education faculty members, and certain executives, but employers may refuse to hire or promote any person over age 70. In addition, the prohibition against discrimination in public sector hiring because a person is at least 40 years of age, now applies to public safety occupations such as police, fire, and prison personnel. A separate measure reinstated mandatory retirement at age 55 for State police officers, citing age as a bona fide occupational qualification.

Occupational safety and health. Employers performing the functions of application, enclosure, removal, or encapsulation of asbestos must first obtain a license from the Commissioner of Labor. Employees performing these functions must complete training in asbestos control and removal, pass an examination, demonstrate the ability to perform this work safely, and obtain a performance permit from the Commissioner. The issuance of standards and regulations, and enforcement are the joint responsibililty of the Commissioners of Labor and Health. Employers are prohibited from discriminating against an employee who complains to or cooperates with the Commissioners in administering the Act.

The Division of Workplace Standards of the State labor department, rather than its' Mechanical Inspection Bureau, now has the responsibility for inspecting certain boilers and pressure vessels and maintaining records of those inspections performed for insurance companies by department-certified inspectors.

Plant closings. A Business Retention and Job Retraining Commission was created by Executive Order, with membership including the labor commissioner and other government officials and representatives of organized labor and business. Among its duties, the Commission is to survey all programs designed to encourage the growth or retention of jobs and to retrain or reemploy displaced workers and the chronically unemployed, to coordinate these programs, and evaluate their effectiveness. It is also to offer a comprehensive program for the early detection of business terminations and the effective delivery of governmental services to affected businesses and employees, including advising affected businesses of available business retention programs and advising displaced employees of job training and employment programs.

Employment and training. The Department of Community Affairs was directed to establish a model job-training center to provide counseling, job training and job placement, self-help programs, referral, child care, and technical assistance services to dependent, unemployed, or underemployed urban women.

Other laws. Employers of 50 persons or more in a place of employment are required to establish written rules governing smoking including a policy and procedure to protect the health and comfort of employees from tobacco smoke. The policy must include designated nonsmoking areas and may include designated smoking areas. Administration is by the State Department of Health, which is to submit an evaluation of this act to a legislative committee 18 months after it takes effect.

New Mexico

Occupational safety and health. An Executive Order was issued regulating use of video display terminals by State employees. It addresses problems of stress, visual problems, and musculoskeletal pains by establishing standards dealing with aspects of video display terminal use including lighting and glare, noise levels, airflow and air quality, electrical safety, work area design, operator chairs and footrests, document holders, size and position of display screens, keyboard placement, and scheduled breaks. A review committee was established to monitor implementation of the standards and to make recommendations to the Governor for amendments to the standards when advisable.

The legislature directed, by resolution, the mining safety advisory board to review the State's safety statutes and regulations, develop legislative proposals to modernize the statutes, develop regulations to implement the proposed changes, and report findings to the legislature. Later in the session, a law was passed which among other things expanded the board's role to include preparation of standards and regulations regarding occupational disease in addition to accident prevention, and provided for regularly scheduled board meetings.

Other laws. An amendment to the Criminal Offender Employment Act permits public agencies to now deny any public employment or license to engage in public employment, or in a trade, business, or profession to an applicant or employee who has been convicted of drug trafficking, certain sexual offenses, or child abuse, regardless of rehabilitation.

New York

Wages. On October 11, 1985, the Labor Commissioner appointed a General Industry Minimum Wage Board to conduct a thorough examination of the State's eight minimum wage orders. The board, which is composed of nine members with three each representing the general public, employers, and employees, was asked to give special attention to formalization of overtime provisions, examination of provisions for allowances for uniforms, consolidation of certain wage orders, benefits for part-time employees, new industry coverage, and review of the youth rate provisions.

The Labor Commissioner is now specifically authorized to enter into reciprocal agreements with other States for collection of claims and judgments for unpaid wages based upon claims assigned to the Commissioner.

Persons or corporations performing public work contracts must, upon the request of the fiscal officer, file within 10 days of receipt of the request, sworn payroll records for said public work or for any public or private work performed by the person or corporation during the same period of time as the public work. If the requested information is not provided within the allotted time, the fiscal officer is to order the withholding from payments due of up to 25 percent, not to exceed $100,000, until the request is satisfied.

Child labor. The law restricting the employment of persons under age 18 in occupations involving selling, dispensing, or handling alcoholic beverages was amended to permit work by those under 18, when under specified supervision, as dishwashers, busboys, or in other positions which require handling of containers which may have held alcoholic beverages. The amendment will be repealed June 30, 1986.

Equal employment opportunity. The exemption for executive or policymaking officials at least 65 years of age from the prohibition against mandatory retirement was amended to increase the minimum annual qualifying retirement benefit from $27,000 to $44,000.

North Carolina

Wages. An amendment to the minimum wage law requires matching increases up to $3.60 an hour in the State minimum if the Federal minimum of $3.35 is increased before July 1, 1987.

The legislature repealed the section of a 1984 law which had provided for a pay equity study for the State's classified employees and for the hiring of a consulting firm to develop a job evaluation and pay system.

Equal employment opportunity. A new Handicapped Persons Protection Act was enacted. Among its provisions, employers of 15 persons or more are prohibited from discriminating against qualified handicapped workers in hiring, promotion, discharge, compensation, or terms and conditions of employment. Discrimination by employment agencies and labor organizations is also prohibited. In addition, employers are to make reasonable accommodations to workers' handicaps. Enforcement is through civil action, instituted by the aggrieved person, although no court action may be pursued if judicial or administrative proceedings have been instituted under the Federal Vocational Rehabilitation Act of 1973. Employers are prohibited from retaliating against an employee or job applicant because the person has testified, assisted, or participated in any proceedings or opposed any discriminatory practice under the act.

An act dealing with military property sales includes a prohibition banning employment discrimination against employees because of membership or service in the military forces of North Carolina or the United States.

Occupational safety and health. A comprehensive Hazardous Chemicals Right to Know Act, to be effective May 25, 1986, covers public and private sector employers with 55 gallons or more of any hazardous chemical, and is to be administered by the Commissioner of Labor. Hazardous substances are to be identified and records maintained on the employer's premises, and provisions are included for the release of trade secret substance information in medical emergencies. Specific information is to be provided to local fire chiefs, upon request, on such items as emergency response plans and how to contact employer representatives in an emergency, and to the general public. Adverse action is not to be taken against an employee for helping in an inspection or for testifying in any proceeding under the act.

Employment and training. The North Carolina Employment and Training Act of 1985 was enacted to develop a comprehensive State policy to guide use of employment, training, education, and economic development funds, and other resources toward achieving economic and employment goals. A State Job Training Coordinating Council, to be supported with funds from the Federal Job Training Partnership Act, was created within the Department of Natural Resources and Community Development to oversee the meeting of the State's goals for employment and training. A Job Training Interagency Committee within the Council, with membership including the Commissioner of Labor, is to develop and implement a plan to integrate the Job Training Partnership Act program into the State's economic development efforts. The prior Employment and Training Council was abolished.

North Dakota

Wages. The exemption from wage garnishment for Social Security benefits was amended to permit garnishment of these benefits to enforce child support orders. Also, an exemption from wage garnishment was added for veteran's disability pension benefits, excluding military retirement pay, except in the case of garnishment for child support. The definition of earnings was amended to reflect these changes.

Orders for the withholding of wages for child support issued by other States or by a Federal court, will now have the same effect as an order of a North Dakota court.

Labor relations. A new State and Political Subdivision Employees Relations Act gives covered public employees the right to join or refrain from joining employee organizations and have payroll deduction of dues, to engage in or refrain from engaging in political activities on their own time, and to report job-related violations of State or Federal law without fear of reprisal or discipline. Prohibited are requiring or coercing employees into participating in or reporting on activities other than official duties, requiring employees to contribute earnings for any purpose other than participation in the retirement fund, and restricting or attempting to restrict certain after working hours statements of employees.

Other laws. The law requiring State agencies to grant in-State bidders and sellers preference in purchasing any goods, in an amount equal to the preference given or required by the State of nonresident bidders, was amended to now include a preference for in-State contractors on public construction contracts.

Ohio

Other laws. A 1984 law stipulates that group health care policies and contracts must give to involuntarily terminated employees the option to continue health insurance coverage at the group rate for an additional 6 months. Employers are obligated to notify employees of the right of continuation when they are notified of their termination from employment.

Oklahoma

Wages. Among several major amendments to the prevailing wage law the threshold amount for coverage was increased from $10,000 to $600,000, except that the public body may stipulate that prevailing wages will be paid on lower cost projects; prevailing wage was defined to be that rate determined under the Federal Davis-Bacon Act; the public awarding agency was made liable for any underpayment in wages if it violates provisions requiring that it obtain the prevailing wage rates from the labor commissioner and include them in the public works contract, in addition to the contractor's liability as before; making or receiving a kickback of wages was made a felony; mandatory withholding from payments to contractors of amounts due resulting from violations of the law is now required; and contractors in violation were made subject to debarment for 2 years. Beginning November 1, 1986, contractors will not be eligible to bid on a public works project unless payroll information has been submitted to the U.S. Department of Labor for use in prevailing wage rate determination.

Child labor. The Commissioner of Labor, by issuance of a Hazardous Order under authority granted in the child labor law, has determined door-to-door sales of cookies, candies, magazines, and similar products to be hazardous to children under the age of 15 and therefore prohibited when an employer-employee relationship exists. Schoool sponsored groups, scout groups, or other groups raising funds for their organizations, while exempt from the 15-year minimum age, must provide members with identification cards which include the organization's telephone number for verification purposes.

A joint resolution was adopted proposing a constitutional amendment to be placed on the ballot, in the November 1986 general election, to remove a prohibition on work by women and girls in underground mines and to establish an 18-year minimum age for such work. The current constitutional provision prohibits work in underground mines by boys under age 16.

Equal employment opportunity. Age discrimination in employment by employers, employment agencies, and labor organizations against persons between the ages of 40 and 70 is now prohibited by amendment to the State Civil Rights Act.

Labor relations. The Public Employees Relations Board, which administers the Fire and Police Arbitration Act, was empowered to prevent unfair labor practices by the issuance of complaints, by serving cease and desist orders, and petitioning the court to enforce such orders. Other changes to the Act include a requirement that every negotiated agreement must contain a clause establishing arbitration procedures, rather than mediation and fact-finding procedures as before.

Oregon

Wages. The basic minimum wage rate was increased from $3.10 to $3.35 an hour, effective January 1, 1986. Also, the minimum wage law was amended to specifically cover public sector employees. (Coverage was first established by a previous amendment which removed a prior exemption for the public sector.)

Authority to issue rules under the minimum wage law including rules pertaining to subminimum rates for handicapped workers and student-learners, to overtime pay, and to meal and rest periods, was transferred from the Wage and Hour Commission to the Commissioner of the Bureau of Labor and Industries. Rulemaking authority under the child labor law remains with the Commission.

The wage payment/wage collection law was amended to extend coverage to public sector employees.

A separate Wage Security Fund was established, to be financed by employer payments of a percent of wages, starting in 1986. For a 3-year period beginning July 1, 1986, the Fund is to be used to pay valid wage claims up to $2,000 each of an employee whose employer has ceased doing business and does not have sufficient assets to pay the claim. An amount of up to $200,000 is appropriated continuously from the Fund to the Commissioner of the Bureau of Labor and Industries to administer this act.

Notwithstanding the exemption from the State prevailing wage law for public work projects regulated under the Federal Davis-Bacon Act, contractors and subcontractors must now pay flaggers on such projects, at least the prevailing rate of wage as determined by the Commissioner of the Bureau of Labor and Industries for that classification of work.

Child labor. Special rules were issued for the employment of 16- and 17-year-old minors to act as convassers, peddlers, or outside salespersons, from house to house. Minors under age 16 are barred from such work. Employers of 16- and 17-year-olds in such work must apply to the Bureau of Labor and Industries for a registration certificate, to be issued by and subject to revocation by the Wage and Hour Commission, upon a determination of employer noncompliance with any rule or law covering the employment of minors. Employers must supply each minor with an identification card which includes a picture and the name of the employee and the name and local address of the employer. Minors may not work past 9 p.m., must be furnished transportation to and from the job site by the employer, and may not be transported to another State without written parental consent.

Agriculture. The labor commissioner is now authorized to enter into agreements with agencies of other States for the reciprocal enforcement of farm labor contractor regulatory statutes if the other State has a similar statute providing for reciprocal enforcement.

Upon written application to the labor commissioner, certain small forestry labor contractors who are sole proprietors may be exempted from the requirements in the contractor registration law that a payment bond be posted and that certified copies of payroll records be submitted to the commissioner.

Specifically exempted from the registration law, which applies to both forestry labor and farm labor contractors, are individuals performing labor under an agreement for exchanging labor with each other on land owned or leased by the individuals, individuals working alone or with family members, and educational institutions recognized by the Department of Education.

Employers of farm workers engaged in field activities for the growing and harvesting of food crops for human consumption must provide convenient toilet and handwashing facilities and clean drinking water for such workers. Notice of these requirements is to be posted in English and in the language spoken by a majority of the employees. The new requirements are administered by the Director of the Workers' Compensation Department who handles other safety and health matters and who may delegate enforcement authority to local public health officials.

Equal employment opportunity. Under the nondiscrimination act it was specified that it is not an unlawful employment practice for an employer or labor organization to provide or make financial provision for child care services for the children of employees or members.

Background clearance. The Department of Human Resources may now request, with written consent of the applicant, information from its Central Bureau of Criminal Identification and is to conduct a nationwide criminal records check through the Federal Bureau of Investigation on persons applying for certificates of approval for day care facilities and on prospective or current employees of such facilities. Operation of or employment in a day care facility is prohibited for any person who has been convicted within the previous 5 years of charges including child abuse or neglect, sexual offenses, or drug abuse.

Occupational safety and health. A Community Right to Know and Protection Act was adopted to make information on the use of hazardous substances readily available to the public. Among its provisions, the State Fire Marshall is to collect information from employers on the identity, amount, and location of hazardous substances used, names and phone numbers of personnel qualified to give information about these substances, and any emergency procedures that they have established. The information collected is to be retained for at least 5 years and is to be made available to local public health authorities, fire districts, private safety agencies administering emergency telephone systems, and others if considered essential. The State Fire Marshall will also assist with emergency response planning by appropriate governmental agencies. The public is to be permitted access to records not otherwise protected as a trade secret or by a confidentiality agreement, with provision made for release of such information to health professionals in medical emergencies. An Interagency Hazard Communications Council was created to facilitate development of the hazardous substance survey and to facilitate interagency access to data collected.

The Director of the Workers' Compensation Department is to conduct a biennial review of the State Hazard Communications rules to determine whether classes of employees not required to be covered by Federal rules should be under State rules, and to propose such rules if the Director concludes that such employees should be covered. In addition, employers must now post signs to inform employees that they have a right to information from the employer regarding hazardous substances found in the place of employment.

Economic development. An Enterprise Zone Act was enacted for the purpose of stimulating employment, business, and industrial growth in economically depressed areas of the State by providing assistance to businesses and industries locating or expanding operations in these areas including tax and other incentives. Enterprise zones will be designated by the Economic Development Department on the basis of economic hardship in the area based upon income, employment, and unemployment data.

Pennsylvania

Background clearance. Administrators of public and private schools, intermediate units and vocational-technical schools, including independent contractors and their employees who would have direct contact with children must require prospective employees to submit with their application criminal history records or a statement that the State police central repository contains no such information. All prospective employees of child care services, prospective foster parents, prospective adoptive parents, prospective self-employed family day care providers, and other persons seeking to provide child care services under contract with a child care facility or program who would have direct contact with children must also submit this criminal history information with their employment applications. No person will be employed who has been convicted within 5 years of certain criminal offenses including sexual or other abuse of children.

Puerto Rico

Wages. Minimum wage rates were increased for the Personal Services and Communications Industries under revised mandatory decrees issued by the Commonwealth Minimum Wage Board. Minimum rates for the Personal Services Industry, which includes beauty shops, photographic studios and laboratories, and funeral services, increased from a range of $3.00 to $3.25 an hour to $3.35 effective February 3, 1985. Minimum rates for the Communications Industry, which includes radio, television, telephone, telegraph, and other communications services, increased from a range of $2.40 to $2.50 an hour to $3.35 effective September 2, but with wages retroactive to June 25, 1985.

Child labor. A new measure was adopted regulating the employment or use of children under 14 years of age in show business or artistic activities. The Secretary of Labor and Human Resources, in coordination with the Secretary of the Department of Instruction and the Secretary of the Department of Health, was authorized to promulgate any rules necessary under the law.

Equal employment opportunity. An employee on paid maternity leave, who is paid by her employer less than 75 percent of her normal salary, day wages, or compensation, will now be entitled to receive weekly maternity benefits from the Disability Benefit Fund, in an amount sufficient to assure her of receiving 75 percent of normal income while on leave.

Rhode Island

Wages. Salaried employees receiving at least $200 per week are no longer exempt from the time-and-one-half after 40-hour overtime pay requirement in the minimum wage law unless they are employed in a bonafide executive, administrative, or professional capacity as defined by the Federal Fair Labor Standards Act, and receive a salary which, if computed on an hourly basis, yields at least the applicable minimum wage.

Background clearance. Any person seeking to operate or seeking employment in a facility which is subject to licensing or registration with the Department for Children and Their Families, or seeking employment at the training school for youth involving supervisory or disciplinary power over children or routine contact with them without the presence of other employees, must undergo an employment background check and criminal records check. A similar requirement was enacted for those applying to establish or renew a school or program for very young children which must be licensed or registered with the Commissioner of Elementary and Secondary Education.

Labor relations. Representation of local government on the five-member State Labor Relations Board was provided by changing the composition of the Board to include one representative of industry, instead of two, and one representative of local government. Two members to represent labor were retained.

Occupational safety and health. Among amendments to the Hazardous Substances Right to Know Act, the role of the Department of Health in providing technical assistance to the Department of Labor in such areas as identification of hazardous substances, trade secret procedures, and training programs was eliminated and the director of labor was authorized to contract with qualified agencies or parties for technical services. Also, employers will now be required to submit annually to the labor department updated chemical identification lists and documentation detailing the nature of training provided employees. The labor department is to keep a central file of annually updated chemical identification lists, is to make at least 200 unannounced inspections of employers annually, and may now order the reinstatement, with reimbursement of any monetary losses, of an employee dismissed or disciplined for exercising his or her right to refuse to work with substances for which required information has not been provided.

The Department of Labor is to develop an informational brochure relating to the use of video display terminals in the workplace. The department is also directed to develop, in cooperation with business, industry, and labor, a plan for dissemination of the brochure, and prepare a plan for a series of training programs and seminars relating to information contained in the brochure. Also, a joint resolution extended, from April 15, 1985 to April 21, 1986, the life of a special legislative commission to study the effects of video display terminals on workers.

Employment and training. The Department of Social and Rehabilitative Services will implement a cash bonus program for 100 welfare recipients who have been receiving aid to families with dependent children but who agree to forgo all such benefits, except medical assistance coverage, and return to full-time employment. In addition, employers who participate in the program will receive a tax credit.

The definition of disabled persons for purposes of vocational rehabilitation services provided by the State Department of Social and Rehabilitative Services was amended to specifically include persons suffering from acquired traumatic brain damage.

Other laws. Noting the loss of jobs and plant closings due to increased textile and apparel imports, the legislature adopted a resolution urging passage of the Textile and Apparel Trade Enforcement bill by the U.S. Congress.

A separate House resolution was adopted urging reconsideration of the elimination of the Department of Labor's Boston Regional Office as proposed in the President's Federal budget for the 1986 fiscal year.

South Carolina

Private employment agencies. Numerous changes in the licensing and regulatory law include specific coverage extension to executive search firms, outplacement services, career counselors, and consultants and resumé services performing job market sourcing. Private personnel placement services are prohibited from charging a fee for placement, referral, or consulting services, except when the services result in applicant acceptance of employment and a confirmed starting date is established. The Secretary of State was directed to investigate written complaints of alleged violation and to deny or revoke licenses when violations are found. Other changes affect license fees, waiting period, bonding, advertising, and other matters.

Occupational safety and health. The Commissioner of the Department of Labor was given responsibility for administering and enforcing newly enacted safety codes for elevators and amusement rides. The Commissioner is to promulgate regulations governing maintenance, construction, alteration, inspection, and testing of new and existing elevators and similar equipment. The Commissioner is also to issue permits to operate amusement rides upon application by the owner or lessee and after meeting inspection and liability insurance requirements. Provision was made for both criminal and civil penalties in case of violation of the elevator code and for civil penalties for violation of the amusement rides safety code.

South Dakota

Occupational safety and health. The law regulating mine safety was repealed, inasmuch as jurisdiction in this area is with the Federal Mine Safety and Health Administration.

Other laws. The statutory presumption that an employee is hired for the length of time used in setting wages, such as an assumed annual hiring where an annual salary is designated, was amended to now state only that the time period used for estimating wages is relevant to the determination of the term of employment.

Tennessee

Undocumented workers. It was made unlawful to knowingly employ or refer for employment any illegal alien. This new law, to be enforced by the labor department, applies to employers as well as to any employment agency, contract labor provider, or organized employee organization which makes job referrals. Violation is punishable as a misdemeanor and, in addition, violators will have their license revoked and will be permanently barred from doing business in the State.

Occupational safety and health. A Hazardous Chemical Right to Know Law, applicable to manufacturers, nonmanufacturers, and distributors, was enacted, to be administered by the Department of Labor. Employers are required to maintain and disseminate information on hazardous substances to which workers are exposed, and to provide education and training for employees who handle these materials. Employees may request information about hazardous chemicals and may refuse to work with such chemicals if the information is not provided within specified time limits. Employers are prohibited from discharging or disciplining an employee who files a complaint or participates in a proceeding under the Act. Manufacturing employers and distributors that are regulated by and complying with the Federal Hazard Communication Standard are exempt from some provisions of the Act. Information on hazardous substances must also be provided to the local fire chief and County Health Department. The law will take effect July 1, 1986 for manufacturing employers and on January 1, 1987 for nonmanufacturing.

Administration of the boiler inspection law and of the licensing law for erectors and repairers of boilers was transferred from the Department of Labor to the Department of Commerce and Insurance.

The statutory provisions setting safety standards in mines and authorizing mine inspections were repealed, inasmuch as jurisdiction for these functions is with the Federal Mine Safety and Health Administration.

Other laws. The law regulating compensation of jurors was amended to clarify that railroad employees paid on a mileage basis are to receive the mileage pay they would have received if they had worked instead of serving on jury duty.

Texas

Hours. Retail business employers may not require full-time employees to work 7 consecutive days or deny them at least one period of 24 consecutive hours of time off in each 7-day period in addition to the regular periods of rest allowed during the workday. Employers are to accommodate the religious practices of employees, except where undue business hardship can be demonstrated. In addition, the law that prohibits the sale of goods on both the two consecutive days of Saturday and Sunday was repealed except that a prohibition on the sale of motor vehicles on those 2 consecutive days will remain. Employers whose businesses were closed on Saturdays or Sundays to comply with the Saturday-Sunday Law may not require an employee to work on whichever day the business was previously closed, if he or she had been continuously employed by that employer since before the repeal date.

Equal employment opportunity. Each State agency that submits an annual report relating to equal employment opportunities within that agency must now include the number of their handicapped employees in the statistical information provided to the Governor's office on equal employment opportunity.

Background clearance. The Department of Human Resources was authorized to obtain criminal history information records to investigate owners, employees, and prospective employees of a child care facility for purposes of licensing, registration, or certification. The Department may also obtain these records for residents of a registered family home, persons providing foster care for children, Department employees who are engaged in the direct delivery of protective services to children, and volunteers with a local affiliate of Big Brothers/Big Sisters of America.

Employees and prospective employees of a nursing home or custodial care home are now subject to a criminal records check by the Department of Health through the Department of Public Safety or the FBI identification division at the request of the institution.

Occupational safety and health. A Hazard Communication Act applicable to manufacturers, nonmanufacturers, and distributors was enacted, to be administered by the Department of Health. Employers are required to maintain and disseminate information on hazardous substances to which workers are exposed, and to provide education and training for employees who handle these materials. Employees may request information about hazardous chemicals, and are protected from being discharged or disciplined for filing a complaint or participating in a hearing under the Act. Manufacturing employers and distributors that are regulated by and complying with the provisions of the Hazard Communication Standard issued by the Federal Occupational Safety and Health Administration on November 25, 1983, are exempt from some provisions of the law. Information on hazardous substances must also be provided to the local fire chief.

Economic development. The Central Education Agency, after consultation with the Adult Education Advisory Committee of the State Board of Education and the Texas Economic Development Commission, is to develop industrial training programs to enhance employment opportunities in existing businesses and to encourage development of new businesses in the State. In addition, a new Technology Training Board was created to collect and disseminate information relating to technology training, technology research, and job and industrial opportunities.

Other laws. Resident contractors will be given a preference in bidding on public works projects, except those involving Federal funds, over out-of-State bidders equal to the resident preference given to such bidders by their own State.

Utah

Wages. A Senate resolution directed the Legislative Management Committee to assign to appropriate interim study committees items for study and reports, including overtime pay standards for public employees, a comparable worth pay plan for State employees, payroll withholdings for all child support payments, a displaced homemaker act, and the State's "right-to-work" law.

Equal employment opportunity. Among changes to the antidiscrimination law, the prohibition against age discrimination including a ban on mandatory retirement now applies only to those between 40 and 70 years of age instead of those age 40 and older. The law is now applicable to employers of 15 persons or more each working day in each of 20 calendar weeks instead of employers of 25 or more, and the definition of employee for coverage purposes was amended to include job applicants and to remove an exemption for domestics. Retaliation, because a person has filed charges, testified, or participated in a proceeding, investigation, or hearing, is now prohibited.

A separate provision requires attorneys employed in career service status in the Attorney General's office to now retire at the age of 70.

Occupational safety and health. The Occupational Safety and Health Division of the Industrial Commission is now specifically authorized to investigate worker injury, illness, or complaint, and to seek a search warrant if an employer refuses to permit an inspection. Orders of the Occupational Safety and Health Review Commission are subject to judicial review upon petition of any person adversely affected or aggrieved or by the Administrator of the Occupational Safety and Health Division.

Employment and training. A Job Training Coordination Act was passed to implement the Federal Job Training Partnership Act. A job training coordinating council was created to develop and recommend an employment and training coordination and special services plan, to provide management guidance and review of employment and training programs, and to coordinate activities with private industry councils. Also, an Office of Job Training for Economic Development was created within the Department of Community and Economic Development.

Other laws. A Utah Protection of Public Employees Act was adopted prohibiting employers from bringing any adverse personnel action against an employee who reports waste or a violation of any law or rule, if the employee has given prior notification to the employer and sufficient time has been allowed for corrective action, and if the report is not knowingly malicious, false, or frivolous. Similar protection is also afforded to those employees requested by a public body to participate in an investigation, hearing, inquiry, or other form of administrative review.

Vermont

Wages. The minimum wage rate will be increased from $3.35 to $3.45 an hour, effective July 1, 1986, with further increases to $3.55 and to $3.65 scheduled on July 1, 1987 and July 1, 1988. The rates of $3.45 and above will be required only for those employees who have worked at least 90 calendar days for an employer.

For a bridge project connecting New York State and Vermont, legislation was enacted specifying that hourly wage rates for workers on the Vermont portion be equal to those posted for use on the New York portion, which were higher. Wage rates may be reduced by the Governor if necessary to keep costs from exceeding the amount appropriated for the project.

Worker privacy. A new Polygraph Protection Act was enacted prohibiting employers or employment agencies from requesting or requiring that an employee or prospective employee submit to a polygraph examination as a condition of employment, promotion, or privilege of employment. Employees or prospective employees cannot be discharged or discriminated against for declining to take the examination, for filing a complaint, or for testifying under the Act. Exceptions are provided for law enforcement agencies, employers in the business of selling precious gems or metals, or of regulated drugs, and employers authorized under Federal law to require polygraph examinations. Examiners must comply with several duties such as giving the examinee a copy of this Act and of the examination questions, informing the examinees of their rights, and refraining from asking questions unrelated to job performance including any queries regarding political, religious, or labor union affiliations. Penalties for violation are by fine, imprisonment, or both.

Occupational safety and health. A new Community Right to Know law was enacted. Among its provisions, those who supply hazardous chemicals to employers are to provide them with information including the names of chemicals, their properties, effects of exposure, proper conditions for safe use, including any need for personal protective equipment, and appropriate emergency treatment. Also, each employer is to compile and file a list of all chemicals in the workplace with the Department of Health by December 1, 1986 and with the municipal fire department by January 1, 1987, along with the location of each hazardous chemical, and is to label pipelines containing hazardous chemicals. Names of hazardous chemicals which would divulge trade secrets may be withheld except in a medical emergency.

Employment and training. A youth conservation corps summer work program is to be established by the secretary of the Environmental Conservation Agency in cooperation with the Commissioner of Employment and Training, to provide economic, vocational, and educational opportunities for youths 16 to 21 years of age, at least half of them from among the economically disadvantaged.

Other laws. A Worker Cooperative Corporations Act was adopted governing such aspects as articles of organization; directors and officers; membership shares, fees, and rights and responsibilities; apportionment of net earnings or losses; and use of the term cooperative.

Virginia

Background clearance. A licensed child-caring institution or child care center is barred from employing a person or utilizing a volunteer who has been convicted of any sex crime. Job applicants at such facilities must first obtain a certificate from the Commissioner of Social Services indicating a negative record after a criminal records check. Child care facilities that do not require a license have the option of obtaining a criminal records check and of refusing employment to such convicted persons.

Labor relations. A joint resolution requests the Governor and Attorney General to take steps necessary to enforce the State's "right-to-work" law and to ensure that Virginia-based employees of the Washington Metropolitan Area Transit Authority are afforded the protection of that law.

Occupational safety and health. The Department of Labor and Industry is now responsible for administering occupational health standards in addition to enforcing such standards as before. The labor department replaces the Department of Health as the agency responsible for drafting and submitting to the Safety and Health Codes Commission for adoption rules and regulations pertaining to occupational health, and is directed to request advice from the health department.

Amendments to mine safety provisions add precautions to be taken in the movement of off-track mining equipment, change the allowable speed of belts used to transport employees, and prohibit workers from riding on top of self-propelled mobile equipment. In addition, longwall mines must now have at least three entries except under certain specified conditions and with approval.

The legislature by resolution created a joint subcommittee to study the implementation of an amusement ride safety inspection program at the State and local government levels and to submit any recommendations to the 1986 General Assembly session.

Other laws. Employees who were formerly protected from discharge because of jury duty will now also be protected from any adverse personnel actions taken because of such service.

Washington

Wages. By amendment to the wage collection law, the Director of Labor and Industries is now authorized to enter into reciprocal agreements with corresponding agencies of other States for reciprocal collection of claims or judgments for wages.

A new section was added to the prevailing wage law requiring the director of labor and industries, upon complaint by an interested party, to initiate an investigation to determine if there has been compliance with the law and to hold a hearing if the investigation indicates that a violation may have occurred. Also, the civil penalty amounts and procedures were changed, and contractor or subcontractor debarment from bidding on public works contracts for 1 year following the second violation within a 5-year period was made mandatory rather than at the discretion of the director.

The State operating budget adopted in June 1985 for the fiscal biennium beginning July 1, 1985 includes an appropriation of nearly $46 million for comparable worth implementation resulting from legislative and previous court-ordered pay adjustments for State employees. (A 1983 U.S. District Court decision ordering comparable pay for State employees was overturned on appeal in September 1985 by the 9th U.S. Circuit Court of Appeals.)

Hours. Public employees of the State are now permitted to work flexible-time workweeks if the provision of services to the public or the mission of the agency is not impeded and the employee's bargaining unit, if applicable, and agency approve.

Agriculture. Forestry labor contractors are now subject to licensing and other requirements of the farm labor contractor registration law in the same manner as other contractors. Among other amendments to the law, all covered contractors must post a $5,000 surety bond, must furnish specified job-related information to workers, are prohibited from retaliating against employees for actions under the act, and are subject to civil penalties assessed by the Director of the Department of Labor and Industries for each violation.

Equal employment opportunity. Enforcement of orders by administrative law judges under the Law Against Discrimination in Employment will be expedited in that such orders are no longer automatically stayed upon appeal to the courts.

The State Personnel Board, Higher Education Personnel Board, and State Patrol are required by statute to adopt rules and procedures to be followed for affirmative action in appointments, promotions, transfers, recruitment, training, and career development, including goals and timetables and the monitoring of progress. The affirmative action is to include racial minorities, women, older workers, persons with disabilities, Vietnam-era veterans, and disabled veterans. Annual reports on progress in meeting affirmative action goals and timetables are to be submitted to the State Human Rights Commission which is authorized to conciliate cases of noncompliance. Further enforcement includes referral to an administrative law judge for hearing and issuance of an order requiring action if appropriate, and appeal of law judge's decision to the courts. Affirmative action and equal employment opportunity had been previously established for State agencies and higher education institutions by executive order.

Worker privacy. The law prohibiting the use of lie detectors was amended to now exempt manufacturers or distributors of controlled substances in addition to the previous exemption for those who dispense such substances. In addition, the prior exemption for public law enforcement employees seeking promotion to a rank of captain or higher was eliminated, and violators were made liable for civil penalties. Psychological tests are not prohibited under the law.

Employers must, at least annually, make available an employee's personnel file for inspection upon his or her request. In addition, if requested by an employee, an employer must review all information in the personnel file and remove any irrelevant or erroneous information. An employee who

Labor relations. A prohibition on strikes, and the use of impasse procedures for State uniformed personnel, including arbitration, were extended to apply to advanced life support technicians employed by public employers other than public hospital districts.

Occupational safety and health. Translations in foreign languages or written hazard communication programs, material safety data sheets, and other materials designed to inform employees of their rights relating to hazard communication standards will now be provided by the Department of Labor and Industries to employers or the public upon request, and employers employing non-English speaking employees will make reasonable efforts to post such notices in the employee's native languages. Also, employers are to provide agricultural employees with information and training on hazardous chemicals in their workplace and make available, upon request, any material safety data sheets on incoming shipments of hazardous chemicals. The Department is also to adopt rules for evaluating trade secret claims and procedures for issuing trade secret exemptions and release of this information in medical emergencies.

The Department of Labor and Industries will administer a new law requiring annual safety inspections and operating permits for amusement rides or structures.

Plant closings. The Department of Community Development was directed to study and develop a plan to encourage and assist employee stock ownership plans for acquisition of facilities which would otherwise close, relocate outside the State, or drastically curtail operations. A report on the study, including details of the plan and recommendations for legislation, is to be submitted to the legislature in 1986, and thereafter an annual report on employee stock ownership trusts is to be submitted.

Economic development. A State economic development board was established, composed of citizens from both the public and private sectors, and representatives of business and labor, among others, with the Governor as chairperson. The board is charged with the responsibility for creating a long-term economic development strategy for the State. The objective will be to spur new job creation and investment that is consistent with the preservation of the State's quality of life and environment. A separate legislative committee on economic development was created and authorized to study and review economic development issues with special emphasis on international trade, tourism, investment, and industrial development, and to assist the legislature in developing a comprehensive and consistent economic development policy.

A community revitalization team was established within the Department of Community Development. Representing the combined efforts of that Department, the Employment Security Department, the Commission for Vocational Education, and the Department of Commerce and Economic Development, the team is to provide technical and business assistance upon request to economically distressed areas, including assisting employers and workers faced with substantial business reductions. The team is authorized to promote retraining and reemployment of unemployed workers using links with local economic development efforts.

Employment and training. A 1-year pilot vocational training program to be administered by the State Board for Community College Education was created to provide retraining in vocational skills without tuition payment for persons living in areas with high unemployment who have become unemployed because of large changes in the economy of the State, including plant closures or significant reductions in force.

Other laws. In awarding a purchase contract to the lowest bidder, a local government may consider the tax revenue it would receive from purchasing the supplies, materials, or equipment from a supplier located within its boundaries.

West Virginia

Occupational safety and health. A Community Right to Know law was enacted under which manufacturing employers who normally store 55 gallons or more of hazardous substances must provide specific information on such chemicals, including their names, characteristics, hazards, precautions for safe handling, emergency and first-aid procedures, and quantity of inventory, to the director of the State Health Department, the county sheriff, and local fire chief. The director of health must provide to any resident requesting it, copies of hazardous substance factsheets and other information submitted by an employer for any facility. This law will expire upon passage of any Federal legislation providing similar protection to State residents.

Economic development. Among the provisions of a new Economic Development Act of 1985, a Department of Commerce was re-created. Duties transferred or assigned to it include the promotion of business in the State and facilitating the development of markets for West Virginia products and services. Also, an office of community and industrial development was created within the office of the Governor with responsibilities including a feasibility study for establishing enterprise zones and including a division of employment and training. A prior 1977 law which had created within the office of the Governor an office of economic and community development was repealed.

Wisconsin

Wages. The dollar threshold amount for coverage under the prevailing wage law for municipal public construction was increased administratively from $75,000 to $80,000 where more than one trade is involved, and from $7,500 to $8,000 where one trade is involved. Adjustments in the threshold amounts are made every 2 years on the basis of changes in the U.S. Department of Commerce's composite cost index or other similar index.

Among the executive budget appropriations of the 1985 legislature were supplemental funds to State agencies for the cost of correcting pay inequities based on gender or race. A comparable worth task force was created by executive order in 1984.

Child labor. Minors under the age of 12 may now work in fund-raising sales for nonprofit organizations or for public or private schools, with parental consent. Such work for this age group was previously prohibited under street trade restrictions. Minors under age 9 must be accompanied by a parent or a person at least 16 years of age.

Other laws. A program of temporary financial assistance was established for counties and cities economically depressed because of plant closings, indefinite layoffs, or farm sales resulting in a precipitous increase in unemployment.

Wyoming

Wages. An evaluation of the State job classification system based on comparable worth principles is to be submitted to the joint appropriations committee by the State's personnel administrator no later than November 1, 1985, as a portion of a consultant-prepared plan for a new merit compensation system. The amount of $250,000 was appropriated for development of the new compensation plan.

Equal employment opportunity. Employment discrimination against qualified handicapped persons, including those who would be capable of performing a particular job with reasonable accomodation to their handicap, is now prohibited under the Fair Employment Practices Act.

FOOTNOTES

[1] The legislature met only in a special session in Kentucky and no significant legislation was enacted in the fields covered by this article. Information on the Virgin Islands had not been received in time to include in this article, which is based on information received by Nov. 8, 1985. Unemployment insurance and workers' compensation are not within the scope of this article. Separate articles on each of these subjects are included in this issue of the *Monthly Labor Review*.

[2] Laws to strengthen enforcement of court-ordered child support, in compliance with the new Federal requirements, were adopted in a majority of the States, using nearly identical provisions and language. These laws are not included in the individual State summaries in this article.

[3] The eight States enacting new worker right-to-know legislation in 1985 were Alabama, Louisiana, Missouri, Montana, North Carolina, Tennessee, Texas, and Vermont. All of these but Alabama and Louisiana included provisions extending the right to information on toxic substances to those communities in which such substances are used. Maine, Oregon, and West Virginia, with prior laws giving protection to employees, enacted separate laws providing for community access to toxic substance information.

Shiskin award nominations

The Washington Statistical Society invites nominations for the seventh annual Julius Shiskin Award in recognition of outstanding achievement in the field of economic statistics.

The award, in memory of the former Commissioner of Labor Statistics, is designed to honor an unusually original and important contribution in the development of economic statistics, or in the use of economic statistics in interpreting the economy. The contribution could be in statistical research, in the development of statistical tools, in the application of computers, in the use of economic statistics to analyze and interpret the economy, in the management of statistical programs, or in developing public understanding of measurement issues, to all of which Mr. Shiskin contributed. Either individuals or groups can be nominated.

The award will be presented, with an honorarium of $250, at the Washington Statistical Society's annual dinner in June 1986. A nomination form may be obtained by writing to the Julius Shiskin Award Committee, American Statistical Association, 806 15th Street, N.W., Washington, D.C. 20005. Completed nomination forms must be received by April 1, 1986.

Changes in unemployment insurance legislation during 1985

At the national level, phaseout of Federal Supplemental Compensation was legislated; State developments included the creation of shared-work compensation plans, and changes designed to pay interest on outstanding advances by the Federal Government

DIANA RUNNER

Last year, for the first time in 5 years, the Federal unemployment insurance law was not amended in any way that required States to change their laws. However, the Federal Supplemental Compensation (FSC) Act of 1982 was amended by Public Law 99–15 to phase out payment of FSC benefits. The change specified that only those claimants receiving FSC at the time of phaseout could continue to collect the remainder of their entitlement during uninterrupted periods of unemployment.

In 1985, 12 States[1] amended their laws to include tips in the definition of covered wages for tax purposes. To reflect 1983 amendments to the Federal law, a few States[2] amended their definitions of covered wages in other respects.

Following is a summary of significant changes in State unemployment insurance (UI) laws during 1985.[3]

Arizona

Benefits. The maximum weekly benefit amount was increased from $115 to $125. In July 1986, it will increase to $135.

Disqualification. An individual will be disqualified for voluntarily leaving a job because of commuting difficulties unless he or she can show that the travel requirements are in excess of the normal practice in the occupation and the individual's past practice, or that there are compelling personal circumstances for leaving. Compelling personal circumstances include the need to commute more than 30 miles or for more than 1½ hours from home to work.

Arkansas

Financing. Beginning January 1, 1987, the advance interest tax shall range from 0 to 0.2 percent, depending on the assets of the unemployment insurance fund on the computation date. Shared-work benefits will be charged to employers' experience rating accounts in the same manner as regular benefits. (See *Benefits.*)

Benefits. The maximum weekly benefit amount will be computed as 66 $^2/_3$ percent of the State average weekly wage for the preceding calendar year. A shared-work compensation plan was established which provides for 26 weeks of shared-work benefits. Under such plans, workers who go on a short work schedule in order to avert a layoff receive unemployment benefits for the hours of work lost. Benefits are calculated as a proportion of the ordinary benefit amount for a full week of unemployment.

Disqualification. The "able to work" and "availability for work" provisions may be waived in the event of the death of a member of an individual's immediate family for the day of death and 6 more calendar days. An individual on short-term layoff shall not be required to register for work or to seek work during layoff if he or she expects to be recalled for full-time work within 8 weeks of the layoff. If an individual is not actively seeking work while serving on jury duty, he or she shall not be disqualified.

Administration. The chairman of the State board of review must be a licensed practicing attorney who is not a representative of employers or employees.

California

Financing. The option allowing specified public entities to finance benefits

---

Diana Runner is an unemployment insurance program specialist in the Office of Legislation and Actuarial Services, Employment and Training Administration, U.S. Department of Labor.

through a special contribution system was deleted. These organizations will now be able to choose either fund contributions or fund reimbursement as the financing method. Also repealed was the special reduced rate for an employer whose average base payroll increased 25 percent or more over the previous year's base payroll.

Colorado

Coverage. Legislation redefined "employer" (excluding agricultural, domestic, or nonprofit organizations) to mean an employing unit which employs at least one individual to perform services at any time. Regulations concerning the exclusion from coverage of services in casual labor were changed to specify that the services will be excluded only if cash remuneration to the provider is less than $50 and if that individual is not regularly employed to perform the services.

Benefits. The provision for an alternative base period for covered wages, which consisted of the most recent four quarters, was deleted. The base period is now the first four of the last five completed calendar quarters immediately preceding the individual's benefit year. An individual's benefit year will be 53 weeks if the filing of a new claim results in overlapping any quarter of the base year of a previously filed new claim.

Disqualification. A 10-week deferral of benefits will be imposed if a disqualification is established for an individual's most recent separation. The law now allows the State unemployment insurance division to withhold more than 25 percent of a benefit claim in cases where overpayments have already occurred on the claim.

Connecticut

Financing. A base-period employer who has elected to use the fund reimbursement alternative will not be charged for benefits paid to an individual if the employer continues to employ the individual to the same extent as in the base period.

Disqualification. An individual will not be disqualified for voluntarily leaving a job without sufficient cause if he or she has quit: (1) to care for a seriously ill spouse, child, or parent domiciled with the individual, if the illness has been documented by a licensed physician; or (2) because transportation used to get to and from work has been discontinued and no reasonable alternative transportation is available. An individual will be disqualified from benefits if discharged or suspended for conduct constituting larceny in excess of $50.

Delaware

Financing. The taxable wage base increased from $8,000 to $8,250; on January 1, 1987, it will be raised to $8,500. Beginning January 1, 1986, the maximum basic contribution rate for employers increased to 8.0 percent. An employer which reemploys a former employee within a specified period will receive rehire credits of 25 to 75 percent of the benefits previously charged to its account, depending on the amount of the rehired employee's benefit payments that had been charged to the employer.

Benefits. The maximum weekly benefit increased from $165 to $195. For the period July 1, 1986, to June 30, 1987, the maximum weekly benefit amount will increase to $205. The minimum will remain at $20. After June 30, 1987, the maximum will be computed annually at 66⅔ percent of the Statewide average weekly wage.

Disqualification. A statute now limits to 3 years the period during which the State may collect overpayments made earlier to the claimant.

Florida

Benefits. The maximum weekly benefit amount increased from $150 to $175.

Georgia

Financing. On Jan. 1, 1986, the taxable wage base rose from $7,000 to $7,500.

Benefits. An individual's weekly benefit amount will be determined as 1/50 of total wages earned in the two quarters of highest wages during the base period. (Previously, the benefit was 1/25 of the high-quarter wages.) The maximum weekly benefit amount increased from $125 to $135, and beginning July 1, 1986, it will rise to $145. However, the law specified that if assets of the unemployment trust fund fall below $175 million, the weekly benefit amount will be reduced to $115.

Administration. New legislation permits, rather than requires, the Commissioner to create an Employment Security Agency within the Georgia Department of Labor.

Idaho

Financing. For calendar years 1985 and 1986, the fund contribution rates for experience-rated employers will range from 1.7 to 5.6 percent of taxable wages.

Disqualification. The amount of wages needed to purge a disqualification for voluntary leaving, discharge for misconduct, refusal of suitable work, and voluntary leaving due to marital obligations decreased to 16 (previously 20) times the weekly benefit amount.

Illinois

Financing. For all of calendar 1986 (previously only the first and second calendar quarters), the taxable wage base will be $8,500. Thereafter, it will revert to $7,000 unless legislation is enacted to maintain the higher level. Extended to all of calendar 1986 was the provision that an employer's benefit-wage ratio be determined on the basis of liability in each of the two years (normally three years) preceding the year for which the contribution rate is determined. (Previously this provision applied only to the first 6 months of the year.) New legislation also extended to the last two quarters of 1986 the minimum contribution rate, which will be the greater of 0.2 percent of taxable wages or the product of the adjusted State experience factor multiplied by 0.2 percent; and a maximum rate, which will be the greater of 5.5 percent or the product of 5.5 percent and the adjusted State experience factor for the year, but no higher than 6.7 percent or lower than 6.5 percent. Finally, the emergency contribution rate of 0.6 percent for employers whose rates would be 0.2 percent or higher, which was imposed to ensure adequate fund levels, will be continued through the end of this calendar year.

Benefits. The requirement that an individual's weekly benefit amount be computed as 48 percent of his or her average weekly wage (up to 48 percent of the State average weekly wage), which was due to expire on July 6, 1986, was extended until January 3, 1987. For the same extended period, the formula for dependents' allowances shall be 7 percent of the claimant's prior average weekly wages (not to exceed 55 percent of the State average weekly wage) if the claimant has a nonworking spouse, and 14.4 percent (not to exceed 62.4 percent of the State average) if he or she has any dependent children. The maximum weekly benefit is frozen at $161 until December 31, 1986. The Director of the State's Department of Employment Security now is permitted to prescribe regulations authorizing a deduction from an individual's weekly benefit amount to pay for health insurance, if the individual elects the deduction and it is made under a program approved by the U.S. Secretary of Labor.

Indiana

Financing. The standard rate for employer contributions to the UI fund increased to 5.4 percent. The maximum rate for the most and least favorable schedules was raised to 5.4 percent. Previously, the maximum rates were 2.8 and 4.5 percent.

Benefits. The limitation on wage credits used in computing duration of benefits increased from $3,926 to $4,186. The maximum weekly benefit amount was raised to $90 (previously $84) for persons with no dependents; $106 (previously $99) for those with one dependent; $121 (previously $113) for those with two dependents; $137 (previously $128) for those with three dependents; and $151 (previously $141) for those with four dependents or more. Beginning July 6, 1986, the maximum weekly benefit amounts will increase to $96, $113, $129, $147, and $161, respectively. The required amount of qualifying wages was raised to 1½ times high-quarter wages, with at least $1,500 earned in the last two quarters of the base period and $2,500 earned in the base period as a whole. Formerly, the requirement was 1¼ times the high-quarter wages, with $900 earned in the last two quarters and total base-period wages of $1,500

Administration. The appeal authority for judicial review was shifted from the State appellate court to the State Court of Appeals.

Kansas

Benefits. The maximum weekly benefit amount increased from $175 to $190.

Disqualification. New legislation redefined good cause for voluntary leaving as good cause attributable to the work or the employer. The disqualification for voluntary leaving without good cause changed from 10 weeks (with an equal reduction of benefits) to a duration disqualification or until the individual has earned wages in insured work of three times the weekly benefit amount. The special disqualification for individuals who voluntarily leave work because of domestic or family responsibilities (not including pregnancy), a shift to self employment, retirement because of disability or old age, or school attendance was deleted.

Other legislative changes provided that an individual will not be disqualified for voluntary leaving if the individual left: (1) temporary work to return to his or her regular employer; (2) to enlist in the armed forces, but was rejected or delayed in entering; (3) because a spouse is being transferred by his or her employer to another locality outside a reasonable commuting distance for the claimant; (4) because of unwelcome harassment; (5) as a result of being instructed or required by the employer to perform a service or to commit an act in the course of duties which is in violation of an ordinance or statute; (6) because of illness or injury upon a physician's advice, but finds after recovery that the old job or comparable work is unavailable; and (7) because of violation of a work agreement. Also, the disqualification will not apply if the individual left to accept better work or because of hazardous working conditons.

Administration. The State Depertment of Human Resources was authorized to continue operations until July 1, 1993. The Department's division of employment security will be administered by the Secretary of Human Resources in a manner he or she deems necessary. Formerly, the division was administered by the division director.

Louisiana

Financing. Shared-work benefits will be charged to employers' accounts in the same manner as regular benefits.

Benefits. The computation of the duration of benefits was changed to be the lesser of 26 times the weekly benefit amount or 27 percent (previously 40 percent) of base-period wages. If an individual's high-quarter wages exceed $875, his or her weekly benefit amount will be computed as 1/25 of wages in the two highest quarters of the base period. Wages earned for a successive benefit year must be in insured work. Established was a shared-work compensation plan, under which individuals working shortened schedules to avert layoffs may collect up to 26 weeks of benefits.

Disqualification. An individual will be disqualified for benefits in any week that he or she receives accrued vacation pay or compensation in the form of severance or dismissal pay. However, if the payment is less than the UI weekly benefit amount, the individual may receive the difference.

Maine

Financing. Beginning January 1, 1986, the fund contribution rate for new employers is no more than 4.0 percent (formerly 3.0 percent) or less than 1.0 percent.

Benefits. Remuneration earned for a second benefit year must be in covered employment.

Disqualification. An individual who was discharged because he or she was absent from work for more than two workdays due to incarceration will be disqualified for the duration of the unemployment or until the individual has earned four times the weekly benefit amount.

Administration. The period for appealing a claim redetermination was cut from 20 to 15 days, although the period may be extended up to 15 calendar days if good cause is shown.

Maryland

Disqualification. The pension offset provision was amended to require that an amount equal to any Social Security or Railroad Retirement benefits received be deducted from unemployment benefits if the base-period employer is subject to the provisions of the Social Security Act or the Railroad Retirement Act of 1974.

Massachusetts

Financing. The fund level requirements for the most favorable schedule decreased to 2.3 percent of payrolls, with rates ranging from 1.2 percent to 5.4 percent. The fund requirement for the least favorable schedule was lowered to less than 0.8 percent of payrolls, with rates ranging from 3.0 to 7.2 percent. The contribution rate for new employers was raised to 3 percent. Extended benefits, previously charged to the solvency account, are now charged to the employer to the extent that they are not Federally reimbursable.

Penalties. Any employer who attempts to evade any contribution, or payment in lieu of contribution, or who knowingly makes a false statement or misrepresentation to avoid or reduce any contributions or benefit payments shall be guilty of a felony, and upon conviction shall be fined from $1,000 to $5,000 or imprisoned for no more than 5 years, or both. The penalty for fraudulent misrepresentation to prevent the payment of, or to reduce, benefits is increased to a fine of $100 to $1,000 or imprisonment of 6 months, or both.

Mississippi

Penalties. The monetary penalty for fraudulent misrepresentation by claimants in order to obtain or increase benefits is raised to $100 to $500. The penalty for employers who fraudulently attempt to prevent or reduce benefit payments increases to $100 to $1,000.

Montana

Coverage. The term "employer" was redefined for UI purposes to include any employing unit with annual payroll in excess of $1,000 (formerly $500). "Regularly employed" persons are defined for purposes of the exclusion of casual labor as those performing wage-earning services during at least 24 days of a given quarter.

Financing. The taxable wage base will be computed as 80 percent (previously 75 percent) of the State average annual wage, rounded to the nearest $100. A new enactment deleted the requirement that the taxable wage base not be raised by more than $200 from year to year. The period of benefits and contributions considered when computing contribution rates for experience-rated employers was changed to include all years since October 1, 1981. The maximum rate for the most and least favorable schedules was raised to 6.4 percent, with the minimum rates decreasing to 0.0 and 1.7 percent, respectively. A temporary (until June 30, 1987) surtax was imposed on all employers to fund the repayment of Federal advances to the State UI program. The provision requiring that a specified proportion of taxes (and reimbursements) paid by both taxpaying employers and those not covered by experience rating be used for administrative purposes was amended to require that these administrative costs be funded through a special assessment on the employers rather than a diversion of contributions.

Benefits. The maximum weekly benefit amount will be frozen at $171 until January 1, 1987. An individual's weekly benefit amount will be computed as 49 percent (formerly 50 percent) of the State average weekly wage in the base period. The provision specifying that the waiting week requirement shall not interrupt the payment of benefits for consecutive weeks of unemployment in a new benefit year was deleted. In disability cases, the base period may be designated as the four quarters preceding the disability if a claim is filed within 26 months of occurrence of the individual's disability (formerly 18 months from the date of last employment).

Disqualification. A disqualification for voluntary leaving will occur when an individual leaves work without good cause attributable to his or her employment. The wage criterion for defining suitable work after 13 weeks of unemployment was modified to include work that offers 75 percent of the individual's earnings in previous insured work in the customary occupation (previously 75 percent of the prevailing wage for the occupation). However, no individual will be required to accept a job paying less than the Federal minimum wage. For purposes of applying a labor dispute disqualification, the definition of a labor dispute was changed from a stoppage of work to a strike.

Penalties. A new enactment requires claimants to repay fraudulently obtained benefits with interest charged at the rate of 18 percent a year. However, future benefits may not be used to offset the interest due.

Nebraska

Financing. The law now permits, rather than requires, a successor employer to assume the experience rating of the predecessor employer.

Benefits. The maximum weekly benefit amount is increased from $120 to $126.

Penalties. The statute of limitations on prosecutions for fraudulent misrepresentation is increased to 3 years.

Nevada

Benefits. Any person who is awarded backpay is liable for the amount of UI benefits paid to him or her during the period for which the backpay was awarded. The employer's reserve account will be credited with the amount of such benefits. Also, before the employer pays the employee backpay, the employer must ascertain the amount of UI benefits received by the worker during the period for which backpay was awarded, withhold that amount from the backpay, and forward it to the State employment security department.

New Hampshire

Financing. The fund requirement for the most favorable schedule increases from $100 million to $110 million. When the least favorable schedule is in effect, an adverse-rating charge will be added to all employers' rates in an amount equal to the interest rate on 90-day Treasury bills multiplied by the excess of benefits over contributions for the preceding 3 years. The legislature added a standard contribution rate of 5.4 percent for certain unrated employers. Any benefits paid to a claimant following a disqualification for voluntary leaving, discharge for misconduct, or refusal of suitable work will be charged to the account of the employer who furnished the employment. In cases where a disqualification is not involved, benefits are charged to the most recent employer.

Benefits. The minimum and maximum weekly benefit amounts were increased to $36 and $150, respectively, from $26 and $141. The qualifying wage requirements were raised from $1,700 for the total base period and $800 in each of two quarters to $2,600 for the entire base period and $1,000 in each of two quarters.

Disqualification. The number of weeks of work required to purge a disqualification for voluntary leaving, discharge for misconduct, and failure without good cause to either apply for or accept suitable work increased to 5 consecutive weeks (previously any 3 weeks) of covered work with earnings equal to 120 percent of the weekly benefit amount in each week. The requirement that benefits not be reduced due to receipt of holiday pay unless the number of paid holiday in a calendar year exceeded the total number of legal holidays was deleted. Also deleted was the requirement that the weekly benefit amount be reduced for any week in which an individual received holiday pay.

Administration. The period for appealing an initial determination before an appeal tribunal increased from 7 to 14 calendar days after mailing of the determination by the agency.

New York

Financing. The maximum contribution rate increased from 2.7 to 5.4 percent.

Benefits. A temporary shared-work program was established, to be in effect until Jan. 1, 1989. An individual may receive up to 20 weeks of shared-work benefits.

North Carolina

Financing. The class of benefits noncharged to an employer's account was enlarged to include those based on wages paid prior to the date of separation due to discharge for loss of license, bond, or surety needed for performance of the individual's job; sale of the individual's ownership share of the business; or involuntary leaving for disability or health reasons. Also, the probationary period for new workers was extended from 60 to 100 days. (The probationary period is that span of time during which an employer can discharge an individual for being unable to perform the work for which hired without the individual's UI benefits being charged to the employer's account.)

Disqualification. Disqualifications were added for individuals who lose a license or permit necessary to perform work and for individuals unemployed because the employing unit was sold and the individual had been an owner of the business. An individual will be ineligible for benefits during a disciplinary suspension. A new enactment permits an individual to be temporarily excused from an active search for work. If an employer notifies the employee of a future separation for lack of work, the impending separation will not constitute good cause for leaving.

North Dakota

Coverage. Service for remuneration will constitute employment for UI purposes unless (1) the worker is free from control or direction in the performance of the work; (2) the service is performed outside of all places of business of the enterprise for which it is performed; and (3) the individual is customarily engaged in an independent trade, occupation, profession, or business.

Financing. The standard rate of contributions will be the greater of 5.4 percent of taxable wages or the rate for employers who have a negative-balance reserve ratio. The contribution rate for unrated employers will be the average tax rate for all employers, but not less than 1 percent. However, newly covered employers classified in an industry which has a negative reserve shall pay the standard rate. An employer may qualify for a reduced rate if his or her account has been chargeable with benefits for 24 (formerly 12) consecutive months.

Disqualification. The pension offset requirement will be disregarded if the base-period employment does not affect eligibility for, or increase the amount of, the pension. However, Social Security and Railroad Retirement benefits are excluded from this exception.

Ohio

Financing. The $8,000 taxable wage base was extended until December 31, 1986.

Benefits. The freeze on the maximum weekly benefit amount (a range of $147 to $233) will be extended until January 1987. For calendar years 1988 through 1993, the maximum weekly benefit amount will be computed with an addition to the regularly computed increase equal to one-sixth of the increase that would have taken place in years 1983 thorugh 1986 if the maximum had not been frozen. Ohio extended until December 31, 1986, the requirement that an individual must work 20 weeks at 37 times the State minimum hourly wage to qualify for benefits. During 1986, an individual will not be paid benefits for the waiting week.

Disqualification. For calendar 1986 (as in 1985), a duration disqualification will be purged by 6 weeks of work and earnings of six times the amount required to establish a credit week.

Oregon

Benefits. The temporary State additional benefits program, which was due to expire on June 29, 1985, has been extended until June 27, 1987.

Disqualification. The labor dispute disqualification will not apply if the individual was laid off prior to the dispute and did not work more than 7 of the 21 calendar days immediately preceding the dispute or if the individual unilaterally abandons the dispute and seeks reemployment with the employer, but finds that his or her former position has been filled by a permanent replacement.

Pennsylvania

Financing. Contributing employers will pay a tax of 0.3 percent of taxable wages in 1986 to cover the interest on outstanding advances made by the Federal Government to the State program. However, the provision which specifies that the interest tax will be a variable rate not to exceed 1.0 percent, assessed by the State's Department of Labor and Industry as needed for the payment of interest on outstanding advances, has not changed.

Benefits. A seasonal provision was added to limit the circumstances under which benefits may be paid to workers performing services in connection with commercial canning or commercial freezing of fruits and vegetables.

Rhode Island

Financing. The number of years needed to qualify a new employer for experience rating was raised to 3. The method by which benefits are charged to base-period employers of the same individual was changed from inverse order of employment to the proportion of wages earned by the individual with each base-period employer. Beginning January 1, 1986, the range of rates for the most favorable schedule will be 0.8 to 5.4 percent, and for the least favorable schedule, 2.3 to 8.4 percent. Contributing employers will be assessed a surtax of 0.3 percent whenever the fund balance is less than zero at the end of any second month in a calendar quarter. A new enactment permits, rather than requires, successor employers to continue to pay contributions at their previous rates in the case of total transfers of the business of the predecessor employer. Such employers may also elect to pay at the predecessor employer's rate.

Benefits. The weekly allowance for dependents is changed from $5 to $20 per dependent to the greater of $5 or 5 percent of the claimant's benefit rate for each dependent, up to five.

Disqualification. The disqualification for unemployment caused by a labor dispute is changed from a fixed period of 6 weeks plus a 1-week waiting period to the duration of the labor dispute.

South Carolina

Financing. Beginning January 1, 1986, voluntary contributions to the fund by employers will be prohibited.

Disqualification. Discharge for misconduct is redefined as discharge for cause connected with the employment.

South Dakota

Coverage. The test for determining whether an employer-employee relationship exists is modified to allow services performed for the employer outside the usual course or place of the employer's business. Thus, services for remuneration will constitute employment unless two tests are met: (1) the individual is free from direction and control, and (2) is customarily engaged in an independent trade or business.

Tennessee

Benefits. The maximum benefit will be computed as 1/4 of base-period wages. Tennessee deleted the qualifying requirement that an individual must have earnings in a third quarter of the base period (in addition to the two highest quarters) when the fund falls below $300 million. An individual will not be eligible for benefits if 65 percent or more of base-period wages were earned in the highest quarter of the period.

Disqualification. An individual will not be denied benefits for separation from employment pursuant to a layoff or to a recall that permits the employee, because of lack of work, to accept a separation from employment.

Administration. The period for appealing an initial claim determination and a referee decision was increased to 15 days from date of mailing or delivery of the determination by the agency. A new enactment permits the commissioner to deduct from benefits payable to a claimant the amount of benefits overpaid earlier by another State which requests recovery of the benefits.

Penalties. Added is a 6-year statutory limitation on the period within which the State may attempt to collect overpayments obtained by fraud. The statutory limitation for collection of other benefit overpayments is decreased to 3 years.

Texas

Coverage. A new enactment excludes from coverage services performed by an individual as a direct seller if certain conditions are met. The coverage of farmworkers was amended to include seasonal and migrant workers and, beginning January 1, 1986, to reduce the minimum size of the farmer's payroll and operation requiring coverage from 10 employees in 20 weeks or $20,000 in quarterly wages to four employees in 20 weeks or $7,500 in quarterly wages. Beginning January 1, 1987, these figures will be further reduced.

Financing. The contribution rate for a new employer will be the greater of the average rate for employers in its industrial classification or 2.7 percent. A successor employer must assume the experience rating of the predecessor employer in the event of total transfers of the predecessor's business. Employers may be required to pay an additional tax of 0.1 percent if interest is due on a Federal advance to the State fund and monies to pay the interest are not available from regular sources. Employers who participate in the State shared-work program may be required to make fund contributions of up to 9 percent of taxable wages.

Benefits. The alternative qualifying wage requirement of 2/3 of the maximum amount of wages as defined in the Federal Insurance Contribution Act was deleted. A shared-work program was adopted under which an individual could receive up to 26 weeks of benefits.

Disqualification. The variable disqualification for voluntary leaving to move with a spouse decreased to 6 to 25 weeks.

Utah

Benefits. To qualify for benefits in a second benefit year, an individual must have earned 6 times the weekly benefit amount in insured work subsequent to the beginning of the preceding benefit year and must meet the base-period earnings requirement.

Vermont

Benefits. Beginning July 1, 1986, Vermont changes from a wage-request to a quarterly-wage-record system for determination of benefit rights. Beginning January 3, 1988, the base period will be the first four of the last five completed calendar quarters immediately preceding an individual's benefit year. The State also added an alternative base period, the last four completed quarters preceding the benefit year, to apply if an individual fails to meet the qualifying wage requirement.

Virginia

Financing. The standard rate for employer contributions to the fund increased to 5.4 percent of taxable wages.

Benefits. The minimum and maximum weekly benefit amounts were increased to $58 and $159 (formerly $54 and $150), respectively.

Washington

Financing. For calendar years 1986 and 1987, the employer contribution rates under the most favorable schedule will range from 0.48 to 5.4 percent, and for the least favorable schedule, from 2.48 to 5.4 percent. If a claimant requalifies for benefits after a disqualification for voluntary leaving or for misconduct connected with the work, benefits based on wage credits earned prior to the disqualification shall not be charged to the experience-rating account of the separating employer.

West Virginia

Benefits. The maximum weekly benefit amount will be frozen at $225 until July 1, 1988. Thereafter, the maximum weekly benefit will be determined as 66 2/3 percent (currently 70 percent) of the State average weekly wage. The base-period qualifying wages are increased to $2,200; therefore, the minimum weekly benefit amount rises from $18 to $24. The weekly benefit amount will be computed as 1.0 percent (previously a weighted schedule of 1.5 to 1.0 percent) of the claimant's annual wages. Uniform weeks of potential duration were cut from 28 to 26.

Wisconsin

Financing. Beginning January 1, 1986, the taxable wage base increased to $10,500 and the maximum rate for the least favorable schedule rose to 6.7 percent of taxable wages. New employers (other than construction firms) with annual payrolls of over $10 million may elect to pay a tax of 1.0 percent for the first 3 calendar years. Employers with an annual payroll of less than $100,000 will pay a "solvency rate," ranging from 0.1 to 3.3 percent; rates for other employers will range from 0.8 to 3.3 percent.

Benefits. An individual will be considered "partially unemployed" in any week he or she does not work full time but earns some wages and is eligible for some benefits. Also, no individual may be paid partial benefits of less than $5. Deleted are the specifications concerning the payment of partial benefits that the full weekly benefit will be paid if the claimant has wage income of less than one-half the weekly benefit amount, and that one-half the weekly benefit amount will be paid if wage income is one-half or more of the weekly benefit. Also deleted is the provision which permitted an individual's base period to be extended due to receipt of backpay or of temporary total disability payments under a State or Federal workers' compensation program.

Disqualification. Under certain conditions, a between-terms and within-terms denial of benefits will apply for schoolbus drivers not employed by governmental entities or nonprofit organizations. □

[3] In last year's article on changes in UI legislation during 1984, erroneous information was presented for two of the States: Contrary to the report, the provisions related to financing and disqualification under Rhode Island's UI plan had not been enacted. In the New Jersey section of the article, the voluntary leaving disqualification should have read "4 weeks of unemployment and 6 times the weekly benefit amount," and the discussion of benefit changes should have included a new provision that all benefit weeks will adhere to a calendar week schedule, with each week ending at midnight Saturday.

For the full text of the 1984 study, see Diana Runner, "Changes in unemployment insurance legislation during 1984," *Monthly Labor Review*, January 1985, pp. 43–48.

Key workers' compensation laws enacted by States in 1985

A number of States made major revisions in benefit provisions and 16 established some form of coverage for police officers, firefighters, and emergency service aides

LAVERNE C. TINSLEY

All State legislatures convened in 1985, except for the Kentucky body.[1] As in the past, a myriad of workers' compensation proposals was introduced; 195 were enacted into law.[2]

Sixteen States amended their laws by establishing some form of coverage for police officers, firefighters, emergency service personnel, sole proprietors, and inmates.

Focus on increases in compensation for workers and their dependents brought about major revisions in benefit provisions. Alabama increased maximum weekly benefits for total disability and death to 100 percent (formerly 66²/₃ percent) of the State average weekly wage and the minimum to 27¹/₂ percent (previously 25 percent) of the State average weekly wage for all disability and death. Compensation for permanent partial disability was capped at $220. The 300-week maximum on payments for temporary total disability was removed. Benefits will now be payable for duration of disability. Tennessee established an escalation of maximum weekly compensation for disability and death from July 1, 1985, through June 30, 1990. North Dakota changed its minimum weekly compensation for death from $10 weekly to 50 percent of the maximum weekly benefit. Georgia and North Dakota extended the compensable period for death benefits for dependent children beyond age 18 until age 22 if they are full-time students.

In contrast to these changes and increases, Louisiana froze maximum weekly benefits for 3 years. A similar action occurred in Oklahoma, which will limit benefit increases to every 3 years. The compensable periods for loss of hearing, loss of vision in one eye, and for disability to the body as a whole were extended in Georgia. The burial allowances were raised in four States.

The waiting period for temporary total disability was changed from 2 to 3 days in Hawaii.

Significant revisions were made in the rehabilitation provisions in Connecticut and Maine.

The cap was removed on awards for disfigurement, and compensation will be equal to an amount based on a percentage of the State average weekly wage in Maine.

Claims for compensation from inhalation of asbestos dust are permitted up to 20 years after exposure in Indiana.

A Competitive State Fund was newly established in Hawaii to provide coverage for employers. Alabama and Maine added provisions which prohibit termination of an employee solely because the employee has filed a compensation claim.

Following is a summary of legislation enacted by individual States.

LaVerne C. Tinsley is a State standards adviser in the Division of State Workers' Compensation Programs, Office of State Liaison and Legislative Analysis, Employment Standards Administration, U.S. Department of Labor.

Alabama

Maximum weekly benefits for total disability and death were changed from 66 2/3 percent to 100 percent of the State average weekly wage. Minimum compensation increased from 25 to 27½ percent of the State average weekly wage for all disability and death claims. Weekly compensation for permanent partial disability was capped at $220. The compensable period for temporary total disability was changed from a maximum of 300 weeks to duration of the disability.

A second physician or surgeon may be selected from a list approved by the employer if the employee is dissatisfied with the initial selection.

A statute of limitations for claim filing was extended from 1 to 2 years.

Fellow employee lawsuits are now restricted to cases of willful misconduct only.

Employers are prohibited from terminating employees solely for filing compensation claims or filing safety violations against the employer.

Upon an employee request, employers must establish a safety committee for advising the employer on safety matters in the workplace, which include suggestions from employees.

Alaska

A south central panel was added to the Workers' Compensation Board, thereby increasing the membership to 12 (previously 9).

Arizona

Volunteers of a sheriff's posse are now covered while on a search and rescue mission the same as participants in emergency management training. Sole proprietors and partners are permitted coverage at the discretion of the insurance carrier.

Illegally employed minors are newly entitled to an additional 50 percent of compensation when a work-related accident occurs.

The fine was increased to $500 (previously $100) against employers who refuse to submit books, records, and payrolls for inspection by the Industrial Commission.

Arkansas

All municipal and county officials and employees must now be covered for workers' compensation by their respective employers. Formerly, coverage of such persons was the responsibility of the State.

Funeral expenses were raised from $750 to $1,500.

The City-County Employees' Workers' Compensation Study Commission is authorized to study long-term financing of workers' compensation for city and county employees. A report must be submitted to the General Assembly by July 1, 1986.

California

Burial expenses were increased to $2,000 (previously $1,500).

Employees may now be treated by their personal chiropractor after proper notification has been given to the employer for a change of doctor.

Authority was given the Workers' Compensation Appeals Board to act on or enforce awards involving determination of disability, length, and benefit amount for specified public safety officers.

The custodian of the Uninsured Employers' Fund now has authority to recover benefits paid employees for injuries caused by third parties while working for uninsured employers.

References to "referee" have been substituted with "workers' compensation judge" throughout the act.

Colorado

Participants in Department of Social Services rehabilitation programs, and employees of the State or a political subdivision are now covered under the law. A person performing as a firefighter during an emergency only is also covered. However, several other groups were eliminated from coverage.

Permanent partial disability cases can only be reopened if there has been fraud or mutual mistake of material fact in cases in which the employee has waived all rights for reopening.

A pilot self-insurance program must be established by the Department of Institutions and the Department of Labor and Employment, for the Department of Institutions.

The executive director of the Department of Labor and Employment is authorized to review and analyze possible application of various medical cost containment models and strategies for developing a medical cost containment program for workers' compensation, if feasible.

Connecticut

Costs of medical rehabilitation services for injured workers must be borne by the employer.

Employers' proof of solvency and financial ability to pay workers' compensation claims and injury reports must be submitted to the Board of Compensation Commissioners, instead of to a single Compensation Commissioner.

Any certified self-insured employer who fails or is unable to make compensation payments as required by law will be restricted from self-insuring for a period of 10 years from the due date of the payments. The employer will then be required to insure his or her full liability with any authorized stock or mutual insurance company or association. In such cases, payments will be made from the Second Injury Fund and Compensation Assurance Fund. Failure to insure may result in permanent loss of privileges to do business in the State. Anyone who submits false statements or fails to disclose certain facts in order to obtain, increase, prevent or decrease any workers' compensation benefits or payments is guilty of a class A misdemeanor.

A sum of $75,000 was appropriated to the Workers' Compensation Commission for workers' compensation purposes.

Georgia

Maximum weekly benefits for disability and death were raised from $135 to $155. On July 1, 1986, compensation will again increase, to a maximum of $175. The compensable period for death benefits is up to 400 weeks, or age 65 years, whichever is greater. Total maximum compensation for a spouse, when there are no other dependents, increased to $65,000 (formerly $32,500). Full-time students are entitled to death benefits beyond age 18, or until age 22.

The compensable period for loss of hearing in one ear was extended from 60 to 75 weeks, and for loss of vision in one eye from 125 to 150 weeks. Simultaneously, the compensation period for disability to the whole body was reduced from 350 to 300 weeks.

Compensation for burial was increased from $1,500 to $5,000. Expenses paid for rehabilitation may be recovered from the Subsequent Injury Trust Fund.

Hawaii

The waiting period for temporary total disability compensation was changed from 2 to 3 days. Guidelines must be issued by the director concerning frequency of treatment and reasonable utilization of medical care and services provided by health care providers. Authority was given the Director of Labor and Industrial Relations to approve vocational rehabilitation plans for injured workers and to periodically review progress in each case.

A Competitive State Fund was newly established.

Indiana

A new maximum was enacted ($267, formerly $249) upon which average weekly wages are determined for total disability and temporary partial disability on July 1, 1985, until July 1, 1986, creating a maximum weekly benefit of $178. On July 1, 1986, based on average weekly wages of $285, a maximum weekly benefit of $190 will become effective.

Total aggregate benefits, exclusive of medical benefits, have been set at $89,000, previously, $83,000. On July 1, 1986, and thereafter benefits are limited to $95,000.

Cases of occupational disease from inhalation of asbestos dust after July 1, 1985, are compensable within 20 years, after last exposure (formerly 3 years). The Residual Asbestos Injury Fund is created to compensate employees who are permanently and totally disabled from asbestos exposure on or after July 1, 1985.

Iowa

Coverage is established for inmates performing unpaid community services under a work assignment of value to the State or public; and for volunteer firefighters who sustain injuries during the course of employment.

Rules must be adopted by the insurance commissioner concerning review and approval of group self-insurance plans.

Kansas

Employer liability for coverage is established for certain construction design professionals who perform services at construction project sites.

Louisiana

The modified American Medical Association (AMA) Guides to the Evaluation of Permanent Impairment were amended to indicate an increase in the percentage of disability used for qualifying certain permanent partial disabilities.

Criteria were established for use in determining compensation benefits of part-time employees who work two or more successive jobs. A new formula was enacted for determining supplemental compensation. New time limitations were enacted applicable to claims for medical benefits.

The definition of "injury" was broadened to include an injury to the auditory system as a compensable permanent partial disability.

Employers and insurers are entitled to reimbursement from the Second Injury Fund for all compensation payments made after the first 104 weeks. Formerly, recovery was permissible after 60 percent of all benefit payments had been made. Similarly, the employer or insurer is entitled to recover 50 percent of all reasonable and necessary medical expense payments exceeding $5,000, but less than $10,000. Formerly, recovery payments were allowed up to 50 percent of the first $10,000.

Recovery of compensation by an employer or carrier against a third party, based on the worker's compensation liability, will be the same percentage of recovery by an employee against the third party.

Maine

An employer who discriminates against an employee for testifying, or filing a compensation claim, may be subject to award of back wages, reasonable attorney fees, reestablishment of employee benefits, and reinstatement of the employee's previous job.

Employers who secure their compensation liabilities are exempt from civil actions in cases of personal injury or occupational disease. Previously, employers were only protected against civil actions by employees for personal injury. Agricultural or aquacultural employers with seasonal or casual labor are not liable for securing compensation, nor will they be deprived of common law defenses, if their liability insurance policy is not less than $25,000, with medical coverage of at least $1,000. Additionally, employers of 6 (formerly 4) or fewer agricultural or aquacultural laborers who maintain a liability insurance policy with total limits of at least $100,000, multiplied by the number of employees employed by that employer, and medical coverage of at least $1,000, are excluded from liability for securing compensation payments.

Maximum weekly benefits for disability and death were frozen at $447.92, beginning July 1, 1985, for 3 years; however, on July 1, 1988, the maximum benefit will be adjusted annually to bear the same percentage relationship as the State average weekly wage. Annual cost-of-living increases may not exceed 5 percent or the actual percentage increase in the Stage average weekly wage for the previous year, whichever is less.

Handicapped individuals employed by a sheltered workshop are exempt from the weekly minimum applicable for total disability compensation ($25).

The cap of $7,500 on compensation awards for disfigurement was removed and replaced with a maximum equal to 66–2/3 percent of the State average weekly wage, multiplied by 50.

Payments for total and partial disability under the workers' compensation law will be reduced by any disability benefit payments received pursuant to the Social Security Act or payments received under an employer benefit plan.

New rehabilitation provisions were added to the law. The Employment Rehabilitation Fund was established primarily to make payments to employees who have completed rehabilitation and who sustain a subsequent work-related injury which results in a reduction in earning capacity substantially greater in duration or degree, or both, than that which would have resulted from the subsequent injury alone.

An office of Employment Rehabilitation was created under the direction of a rehabilitation administrator who is primarily required to monitor rehabilitation cases and approve rehabilitation agreements and develop fee schedules of services. Rehabilitation services will be provided by private and public rehabilitation counselors, governmental agencies, in-house counselors, and others approved by the administrator.

Rehabilitation benefits may include physical rehabilitation, weekly travel costs not exceeding 25 percent of the State average weekly wage, reasonable moving and relocation expenses up to $3,000, and compensation up to an amount payable for total incapacity, during the course of rehabilitation. A Unit of Abuse Investigation was created to review and investigate allegations of fraud or illegal or improper conduct or violations of the workers' compensation program by employers, employees, or insurers.

Maryland

New legislation extends the presumption of compensability regarding lung and heart disease of firefighters, and fire fighting instructors, to include throat, prostate, rectal, leukemia, or pancreatic cancer caused by contact with toxic substances encountered in the line of duty. To be eligible for such compensation, these employees must have served at least 5 years and be unable to perform their normal duties because of the cancer disability.

Corporate officers owning 20 percent or more of the outstanding capital stock of a corporation are allowed an exemption from coverage. Previously, any officer could be exempt.

The Uninsured Employers' Fund is now authorized to seek recovery of payments made to claimants from liable third parties.

Insurers who fail to comply with insurance certification requirements may be assessed additional fines of $300, for each offense.

Michigan

Payment of death benefits to dependent children will cease at age 18, formerly 21, unless the child is incapacitated.

Coordination of workers' compensation benefits was extended to include employer contributions in other profit-sharing plans.

Injured workers who are unable to obtain or perform work because of imprisonment or commission of a crime are not entitled to compensation.

Definitions of hand and arm were modified by establishing that an amputation between the elbow and wrist of 6 or more inches (formerly 7) below the elbow is considered a hand.

The fine charged an employer for not securing liability for workers' compensation was increased to $1,000; previously the fine ranged between $10 and $100.

Employees injured on the job are permitted to recover damages for their injuries in civil actions when the employer has failed to secure liabilities for benefits required by law. Attorney fees for claims filed after March 31, 1986, will be limited to 2 years of benefits when claims are on appeal before the Appellate Commission.

Employers of workers who are certified as vocationally handicapped will be liable for benefits 52 weeks after date of injury (previously 104 weeks).

Minnesota

Voluntary participation of employees in recreation programs sponsored by the employer is no longer the responsibility of the employer when injury occurs. Coverage is only required when the employee is ordered to participate in such activity.

Authorization for receipt of permanent partial disability benefits, in conjunction with compensation for temporary partial disability, may be granted after the employee has returned to work for at least six months.

Minimum compensation during the monitoring period is 66-2/3 percent of the weekly wage for permanent partial disability, subject to the maximum stated in the law.

Montana

Coverage will now be provided by the Department of Commerce for unsalaried air search and rescue volunteers for whom the Department employs. Officials, such as a timer, referee, or judge at a school amateur athletic event and a direct seller engaged in the sale of consumer products for use primarily in the home are exempted from coverage.

Lump-sum payment for permanent total disability is authorized only if a claimant demonstrates that ability to sustain himself or herself is more probable with a lump-sum payment. A 7-percent discount, compounded annually, will be applied to lump-sum payments. Advance lump-sum settlements payments are permitted for permanent partial indemnity benefits while a claimant is receiving temporary total disability benefits.

Temporary total disability payments are limited during retraining periods. Such payments were previously allowed until the employee was released through certification by the Department of Social and Rehabilitation Services. Compensation for schedule injury, disfigurement, and temporary total disability may now be paid concurrently, instead of consecutively.

Permission is authorized for employees to have a physician of their own choice present at medical examinations at no cost to the employee. A medical fee schedule must be adopted as a relative value fee schedule (RVS) upon which payment is determined for medical, chiropractic, and paramedical services. Insurers are solely responsible for furnishing reasonable medical services, medicines, and any other treatment approved by the Division.

The filing time for occupational disease claims is extended from 1 to 2 years, after the claimant knew or should have known that his or her condition resulted from an occupational disease.

A new provision allows a group of individual employers to operate as self-insurers and requires that each individual employer in a self-insured group is jointly and severally liable for all obligations of the group.

A new limit of $50,000, formerly $30,000, is placed on withdrawals from the uninsured employers' fund by employees.

Nebraska

Maximum weekly benefits for disability and death were increased from $200 to $225.

Nevada

A 20 percent cost-of-living increase was enacted for recipients of permanent total disability and death benefits where injury, disablement, or death from an occupational disease occurred prior to July 1, 1973. Employees are permitted to report tips for purposes of calculating workers' compensation benefits.

Occupational disease coverage was extended to include a chief or inspector of the Nevada highway patrol, a chief, investigator, or agent of the Investigation Division of the Department of Motor Vehicles. Coverage of the clergy, a rabbi, or a lay reader in the service of a church has been eliminated. Trainees in training programs approved by the Job Training Partnership Act may be covered under certain conditions.

Services of chiropractors may be utilized for treatment by injured workers. Health care providers who accept patients for treatment of industrial injury or occupational disease care only have authority to charge the insurer for payment of any services rendered. However, the health care provider is able to charge the patient for any services provided that are unrelated to the work-related accident.

Regulations were established which insurers must follow when rehabilitation services are prescribed for injured workers.

Local governments have authority to enter into cooperative agreements to purchase workers' compensation insurance or to establish self-insurance. Assessments will be made against self-insured employers to cover claims against insolvent self-insured employers. The filing time in which certain appeals must be made was changed.

New Hampshire

Coverage was broadened to include call firefighters and special police officers.

New York

Emergency medical service personnel, without expectation of monetary compensation who are injured while rendering volunteer assistance at the scene of an accident, or other emergency services, are newly covered for compensation.

Self-employed persons and certain partners of a partnership are allowed an election for coverage. Corporate executives covered under the act must now be paid officers in order to maintain their covered status.

Employers must provide additional medical services for injured employees, including orthotics and functional assistance and adaptive devices. The Workers' Compensation Board Chairman is required to follow certain procedures in preparation of occupational therapy fee schedules.

A portion of the law was repealed concerning the Board's authority to commute all compensation for nonresident alien dependents in death cases. The fine assessed against employers who fail to make provision for payment of benefits was increased.

North Carolina

Agricultural extension service employees who are not employed as Federal employees of the U.S. Department of Agriculture, but who are field faculty with professional rank, and for those who are paid from State or county funds are newly included for coverage.

Minimum weekly benefits were established for volunteer firefighters, members of organized rescue squads, sworn members of auxiliary police departments, and for senior members of the State Civil Air Patrol, at 66 2/3 percent of maximum weekly benefit rate in effect at the time of injury.

A reduction in total disability benefits will be applied by the amount of any simultaneous unemployment insurance benefits received.

The statute of limitations was extended, from 6 months to 1 year, for actions involving protection of claimants from discharge or demotion for filing compensation claims.

Regulation of self-insurance is under the authority of the Insurance Department, formerly under the Industrial Commission.

North Dakota

Elective coverage for inmates is authorized for any county or city by resolution of the governing body. Definition of "child" has been modified to include a child under age 18 and residing in the employee's household to whom the employee has a legal obligation for support; or a child age 18 or over and physically or mentally incapable of self-support, who is actually dependent upon the employee for support; or any child age 18 to 22 who is enrolled as a full-time student in any accredited educational institution who is actually dependent upon the employee for support.

Compensation for death was changed from a weekly minimum of $10 to 50 percent of the maximum weekly benefit for death ($210). The new minimum is now $105. Supplementary compensation has been authorized for certain recipients of temporary total disability, permanent total disability, and for death.

An information program was set up to instruct employers concerning the use of hazardous substances in the workplace. The Workers' Compensation Bureau is required to inspect and enforce safety rules and regulations as required by law.

Ohio

A provision was enacted which gives the court authority to order a certain portion of workers' compensation payments be withheld for child support.

Oklahoma

Farmers whose payroll for the preceding calendar year did not exceed $100,000 are not liable for work-related injuries sustained by an employee of an independent contractor or subcontractor. Previously, employer payroll had to exceed $100,000.

Effective July 1, 1984, and every 3 years thereafter, the State average weekly wage (SAWW) used for establishing maximum weekly benefits for injuries and death will be increased. Formerly, the State average weekly wage and compensation benefits were changed every 12 months.

The term "permanent impairment" was modified by requiring any examining physician to evaluate impairment only in accordance with "Guides to the Evaluation of Permanent Disability" published by the American Medical Association (AMA); formerly, more flexible guidelines were utilized.

Oregon

The statute of limitations for filing claims for occupational disease was extended from 1 to 2 years.

The coverage exclusion was broadened with the addition of certified amateur sports officials and volunteer ski patrolees who receive noncash remuneration for services rendered.

Monthly benefits for a surviving spouse with no children is 4.35 times 66 2/3 percent of the State average weekly wage. However, the maximum monthly benefit payable for dependency may not exceed 4.35 times 133 1/3 percent, formerly 100 percent, of the State average weekly wage. Lump-sum payments to a surviving spouse upon remarriage is equal to 24 times the

Table 1. Jurisdictions which increased maximum weekly temporary total disability benefits during 1985

Jurisdiction	Former maximum	New maximum
Alabama	$260.00	$303.00
Alaska	$1,080.00	$1,114.00
Colorado	$315.98	$336.00
Connecticut	$381.00 plus $10 for each dependent under 18 years of age, not to exceed 75 percent of employee's wage	$397.00 plus $10 for each dependent under 18 years of age not to exceed 75 percent of employee's wage
Delaware	$231.04	$236.09
District of Columbia	$396.78	$413.26
Florida	$290.00	$307.00
Georgia	$135.00	$155.00
Hawaii	$291.00	$301.00
Idaho	$240.30 to $346.25, according to number of dependents, plus 7 percent of State's average weekly wage for each child up to 5 children	$260.00 to $361.23, according to number of dependents, plus 7 percent of State's average weekly wage for each child up to 5 children
Illinois	$491.65	$502.28
Indiana	$166.00	$178.00
Iowa	$560.00	$588.00
Kansas	$227.00	$239.00
Kentucky	$294.67	$304.00
Louisiana	$248.00	$254.00
Maine	$426.40	$447.92
Maryland	$311.29	$327.00
Massachusetts	$341.06, plus $6 for each dependent, if weekly benefits are below $150	$359.50, plus $6 for each dependent, if weekly benefits are below $150
Michigan	$304.00	$366.00
Minnesota	$329.00	$342.00
Mississippi	$126.00	$133.00
Missouri	$262.73	$283.84
Montana	$279.00	$292.00
Nebraska	$200.00	$225.00
Nevada	$325.90	$362.46
New Hampshire	$440.00	$462.00
New Jersey	$255.00	$269.00
New Mexico	$289.20	$298.63
New York	$275.00	$300.00
North Carolina	$282.00	$299.00
North Dakota	$285.00, plus $5 for each dependent child; aggregate not to exceed worker's net wages	$291.00, plus $5 for each dependent child; aggregate not to exceed worker's net wages
Ohio	$335.00	$354.00
Oklahoma	$212.00	$217.00
Oregon	$324.13	$334.58
Pennsylvania	$380.00	$409.00
Rhode Island	$292.00, plus $9 for each dependent; aggregate not to exceed 80 percent of worker's average weekly wage	$307.00, plus $9 for each dependent; aggregate not to exceed 80 percent of worker's average weekly wage
South Carolina	$268.90	$287.02
South Dakota	$247.00	$254.00
Tennessee	$136.00	$148.00
Texas	$203.00	$217.00
Utah	$310.00, plus $5 for dependent spouse and each dependent child up to 4 children, but not to exceed 100 percent of State's average weekly wage	$323.00, plus $5 for dependent spouse and each dependent child up to 4 children, but not to exceed 100 percent of State's average weekly wage
Vermont	$278.00, plus $10 for each dependent under age 21	$293.00, plus $10 for each dependent under age 21
Virgin Islands	$173.00	$183.00
Virginia	$296.00	$311.00
Washington	$356.21	$366.54
West Virginia	$321.20	$332.60
Wisconsin	$306.00	$321.00
Wyoming	$359.67	$366.86

Note: Most benefit increases are based on the applicable jurisdiction's average weekly or monthly wage. However, nine States (Arizona, Arkansas, California, Georgia, Indiana, Mississippi, Nebraska, New York, and Tennessee) and Puerto Rico prescribe statutory amounts. Four States (Arizona, Arkansas, California, and [illegible]) and Puerto Rico are not listed because no changes for temporary total disability were legislated during 1985.

monthly compensation benefit; formerly, payments were limited to $5,000.

Permanent partial disability benefits were increased from $100 to $125 for each degree of disability. Employees who are released by a physician to return to work may refuse to return if a labor dispute is in progress, without loss of any vocational assistance benefits or services.

Abolishes provisions concerning the authority of the Director of the Workers' Compensation Department to establish and operate a physical rehabilitation center. Services formerly provided for injuries at the centers will be handled by government or private sources and in the most economical manner. The director is authorized to order insurers and self-insurers to provide disability prevention services for workers such as physical restoration and psychological, psychiatric, and vocational evaluation and counseling. Costs for rehabilitation will come from the Administrative Fund, in lieu of the Rehabilitation Reserve Fund.

The director has authority to develop a medical fee schedule based on general descriptions of medical services, considering the primary health care providers in a certain geographic area. The percentile used by the director in determining usual and customary fees for health care services was decreased from the 90th to the 75th percentile.

Pennsylvania

Appropriates $11,213,000, from the Workmen's Compensation Administration Fund to the Department of Labor and Industry to cover expenses for administering the Workmen's Compensation and Occupational Diseases Act.

Rhode Island

Continuation of employee health benefit insurance payments must be made by the employer for 1 year after the employer has filed a memorandum of agreement or notice of direct payment with the Division of Workers' Compensation.

Compensation payments for impairment will not be made until the employee reaches maximum medical improvement. Within 90 days after the employer is notified of the employee's attainment of maximum medical improvement, compensation payments become due and payable.

Unless a memorandum of agreement has been made by the employer and claimant, or a notice of controversy has been filed, first payment of compensation for incapacity or death is due and payable within 14 days after the employer has knowledge of injury or death.

New procedural provisions were added to the law concerning benefits to workers in controverted cases.

Employers are entitled to recovery of payments made to claimants who aggravate a preexisting condition, or for a subsequent injury resulting in death from the Second Injury/Indemnity Fund in excess of the first 52 weeks, formerly 104 weeks.

South Carolina

Coverage is extended to members of the State and national guard while performing work-related duties for the State.

South Dakota

The burial allowance was increased from $2,500 to $3,000.

Tennessee

Ten employers or more of the same trade or professional association are permitted to pool their compensation liabilities for purposes of qualifying as group self-insurers for workers' compensation. Maximum and minimum weekly compensation and total maximum compensation for disability and death were increased in steps, on July 1, 1985, through June 30, 1990.

No change was established for minimum benefits as of July 1, 1989. Presently, maximum and minimum weekly benefits are $168 and $20, respectively; on July 1, 1986, amounts will increase to $189 and $25; to $210 and $30, on July 1, 1987; to $231 and $35 on July 1, 1988; and the weekly maximum will increase to $252, on July 1, 1989. Total maximum compensation for disability and death was raised from $54,000 to $67,200, on July 1, 1985. From July 1, 1986, through July 1, 1989, total maximum benefits will increase from $75,600 to $100,800.

Physicians are required to use the American Medical Association "Guides to the Evaluation of Permanent Impairment," in determining degree of impairment of an injured employee.

The Second Injury Fund is responsible for making compensation payments to injured employees for awards or a combination of awards exceeding 100 percent of disability to the body as a whole. Recovery of permanent disability benefits for disablement or death resulting from an epileptic seizure is compensated solely from the Second Injury Fund.

Totally disabled employees from coal workers' pneumoconiosis are entitled to workers' compensation benefits equal to those provided for under the Federal Coal Mine Health and Safety Act of 1969 (FCMHSA). In case of the employee's subsequent death, the surviving dependents will receive the same benefit payments to which the employee was entitled, except that minimum benefits will be paid according to the FCMHSA.

Texas

A method was established by which a claimant may enforce a compromise settlement approved by the Industrial Accident Board or an agreed judgment approved by the court. Reasonable attorney fees are available for claimants in such instances.

Utah

Weekly benefits for permanent total disability payable from the Second Injury Fund were increased from $100 to $120. The interest rate charged employers who default in their assessments to the State Fund was changed from 12 percent to the current interest rate charged by the U.S. Internal Revenue Service for delinquent taxes.

Virginia

State-designated mine rescue team members are covered during service as employees of the mine's operator in an emergency.

Washington

The Department of Labor and Industries must pay all fees and medical charges billed to the Department, within 60 days after receipt, or within 60 days from the time a claim is authorized by a final order or judgment.

An employer is not permitted to discharge or discriminate against an employee because the employee has filed or communicated his or her intention to file a claim for compensation or exercise any other rights under the law.

Various fines were set for employers who fail to file certain reports.

Wyoming

Interfund interest free loans from the budget reserve account not exceeding $15,000,000, are permitted from the budget reserve account if the State treasurer determines that the reserves to pay workers' compensation are inadequate. □

FOOTNOTES

[1] The legislatures of Delaware, Florida, Idaho, Illinois, Massachusetts, Mississippi, Missouri, New Jersey, New Mexico, Vermont, West Virginia, Wisconsin, the District of Columbia, and Puerto Rico convened in 1985, however, workers' compensation enactments were insignificant and are not discussed in the State-by-State summary or none were received. Kentucky was the only State that did not meet in 1985.

[2] Legislative enactments received as of our reporting date.

Research Summaries

Occupational pay in the manufacture of men's and boys' suits and coats

Straight-time earnings of production and related workers in men's and boys' suit and coat manufacturing averaged $6.29 an hour in June 1984, according to a recent survey by the Bureau of Labor Statistics.[1] (See table 1.) Virtually all of the 46,716 production workers covered by the survey had earnings between $3.35, the Federal minumum, and $10 an hour; the middle 50 percent earned from $4.87 to $7.45. Earnings levels varied by such factors as occupation, geographic location, method of wage payment, sex, type and size of establishment, union status, and size of community.

The $6.29 average for all workers in June 1984 was 28 percent higher than the $4.93 average recorded in the Bureau's April 1979 survey of the suit and coat industry.[2] This increase, averaging 4.8 percent annually, compares with an annual increase of 6.8 percent in the wage and salary component of the Bureau's Employment Cost Index for nondurable goods manufacturing industries over the same period.

Much of the increase in average hourly pay since the April 1979 survey stems from general wage adjustments granted under collective bargaining agreements between the Amalgamated Clothing and Textile Workers Union and the Clothing Manufacturers Association of America. The current agreement, which expires May 31, 1985, provides for wage increases totaling $1.05 an hour over its 3-year term. Establishments with labor-management contracts covering a majority of the production work force employed nearly four-fifths of the workers in the scope of the survey.

Employees in regular establishments, representing 83 percent of the total work force, averaged $6.29 an hour—the same as the average for all workers. Regular (or "inside") establishments own the materials and perform all or nearly all of the manufacturing operations required for suit and coat fabrication, including marking, cutting, sewing, and inspecting. Employees in contract establishments—14 percent of the workers—averaged $6.10 an hour, while those in cutting establishments—about 3 percent of the work force—averaged $7.61. Contract establishments perform manufacturing operations on materials owned by others. Cutting establishments own the material and cut the cloth, but deliver it to contract establishments for the remaining processes.

Thirty-two occupations were selected to represent the wage structure, worker skills, and manufacturing operations in the industry; they covered slightly less than four-fifths of the industry's production work force. Nationwide, pay levels were usually highest among cutting room occupations. For example, cloth cutters and markers had the highest average pay ($9.40), followed by cloth cutters ($9.02) and lining cutters ($8.77). Janitors ($5.09) and work distributors ($5.45) recorded the lowest averages.

Sewing-machine operators, representing about one-half of all production workers in the survey, averaged $6.17 an hour on coat fabrication and $5.81 on trouser fabrication. Their earnings, however, varied by the specific task performed. In coat fabrication, average pay ranged from $5.93 for workers who tack facing to front of garment with a blind stitch machine (facing tacking) to $6.84 for those who join collars and lapels to canvas by numerous rows of blind stitching (pad collar and lapels). In trouser fabrication, sewing-machine operators averaged from $5.72 for serging to prevent ravelling to $6.54 for attaching zippers.

Virtually all production workers were in establishments providing paid holidays and vacations. Typical provisions were for 10 paid holidays annually and 3 weeks of vacation pay after 1 year of service and 4 weeks after 20 years.

Virtually all workers were covered by lift, hospitalization, surgical, and medical insurance. Sickness and accident insurance was available to four-fifths of the workers; major medical, to just over one-third; and accidental death and dismemberment plans, to three-tenths. Long-term disability and dental insurance plans each applied to less than one-tenth of the work force. Employers typically paid the total cost of these health and insurance plans.

Retirement pension plans (in addition to Federal Social Security) covered slightly more than nine-tenths of the industry. Most of these workers had plans financed wholly by their employer. Retirement severance plans, however, were rarely provided.

For about seven-tenths of the workers, employers provided health, welfare, and retirement benefits through the Amalgamated Clothing and Textile Workers Union employer administered funds. Nearly two-fifths of the industry's production workers were in plants where employers provided vacation benefits through such funds.

A comprehensive report on the survey, *Industry Wage Survey: Men's and Boys' Suits and Coats, June 1984*,

Table 1. Average hourly earnings[1] of production workers by selected characteristics and in selected occupations, men's and boys' suit and coat manufacturing, June 1984

Characteristic	United States[2]	New England	Middle Atlantic	Border States	Southeast	Southwest	Great Lakes

[1] Excludes premium pay for overtime for work on weekends, holidays, and late shifts.

[2] Includes data for regions in addition to those shown separately. The regions are defined as follows: New England—Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont; Middle Atlantic—New Jersey, New York, and Pennsylvania; Border States—Delaware, District of Columbia, Kentucky, Maryland, Virginia, and West Virginia; Southeast—Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, and Tennessee; Southwest—Arkansas, Louisiana, Oklahoma, and Texas; and Great Lakes—Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin. Alaska and Hawaii were not included in the study.

[3] Includes data for workers not classified by sex and by major products in addition to those shown separately.

[4] Metropolitan Statistical Areas, as defined by the U.S. Office of Management and Budget through June 1983.

[5] Regular establishments own the materials and perform all or nearly all of the required manufacturing operations; cutting establishments own the material and cut the cloth, but deliver it to contract establishments for the remaining processes; and contract establishments perform manufacturing operations on materials owned by others.

[6] Data relate to establishments where a majority, or a minority, or none of the production workers are covered by labor-management agreements.

NOTE: Dashes indicate no data or data that do not meet publication criteria.

Bulletin 2230 (Bureau of Labor Statistics, 1985) is for sale by the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. The report provides additional information on occupational earnings and employee benefits. □

FOOTNOTES

[1] The survey covered establishments employing five workers or more which were primarily engaged in manufacturing men's, youth's, and boys' suits, coats, and overcoats (part of SIC 2311, as defined in the 1972 edition of the *Standard Industrial Classification Manual* prepared by the U.S. Office of Management and Budget). Included in the study were establishments manufacturing tailored suits, separate coats or jackets, overcoats and topcoats, uniforms, and suit vests. Jobbers who perform only entrepreneurial functions—such as buying material, arranging for all manufacturing to be done by others, and selling the finished product—were excluded from the survey, as were separate auxiliary units such as central offices.

Wage data reported in this article exclude premium pay for overtime and for work on weekends, holidays, and late shifts.

[2] For an account of the 1979 study, see *Industry Wage Survey: Men's and Boys' Suits and Coats, April 1979*, Bulletin 2073 (Bureau of Labor Statistics, 1980).

Major Agreements Expiring Next Month

This list of selected collective bargaining agreements expiring in February is based on information from the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more. Private industry is arranged in order of Standard Industrial Classification.

Employer and location	Private industry	Labor organization[1]	Number of workers
Associated General Contractors of New Jersey (New Jersey)	Construction	Laborers	5,000
Campbell Soup Co. (Camden, NJ)	Food products	Food and Commercial Workers	1,400
American Crystal, Holly, Amstar, and others (California)	Food products	Distillery, Wine and Allied Workers	1,200
Farah Manufacturing Co., Inc. (El Paso, TX)	Apparel	Clothing and Textile Workers	4,000

Book Reviews

A look at American labor unions

Union Sourcebook—Membership, Structure, Finance, Directory. By Leo Troy and Neil Sheflin. West Orange, NJ, Industrial Relations Data and Information Services, 1985. 161 pp. $25.

Leo Troy and Neil Sheflin try to fulfill two major purposes with publication of their *Union Sourcebook*. They fill the void left by the termination, in 1980, of the biennial program that produced the BLS *Directory of National Unions and Employee Associations*. They also try to assemble in one place " . . . a more current, accurate, and comprehensive profile of organized labor, as well as a unique statistical view of union membership over the course of the 20th century." This is the only book of its kind now being published and, despite its defects, the interested community should welcome its publication.

Chapters 1 and 2 contain a brief look at the state of American unions in terms of membership and recent events, while chapter 3 is a closer look at the specifics of membership. There is a certain parallel between the *Sourcebook's* chapters and several that appeared in the BLS *Union Directory*. However, what is different in the *Sourcebook* is chapter 4. Here are presented financial summaries of almost 200 labor organizations for 1982 and more detailed financial data for 50 of the largest organizations. (The source of the financial information is the file of annual union reports required under the Labor Management Reporting and disclosure Act of 1959. These reports are held by the U.S. Department of Labor.)

The authors note that the largest expense items, not unexpectedly, are salaries and benefits paid to officers and employees and that net income of the 200 labor organizations has risen over the 1980–82 period, while membership had declined. Members still contribute the lion's share to income—two-thirds in 1982, down from three-fourths in 1980. Presumably, the fall-off in income from members is made up by union investments in various income-producing areas. The authors note, too, that organized labor's total assets increased over the 2 years, from $2.5 billion to $3.1 billion. Chapter 4 contains a large number of tables which provide data on total income, expenses, net income from members, assets, liabilities, and net assets in 1982 for the 200 organizations. For the 50 largest organizations, income, expense, assets, and liabilities are shown in considerably more detail.

Chapter 5 takes a look at the structure of organized labor in the United States. Chapter 6 provides a "Directory" listing which includes for each union, name, estimated membership in the United States and Canada for the years 1981–83; the year in which the union was founded; names and salaries of the two key officers; and addresses and telephone numbers. The final chapter provides State breakdowns of membership and international comparisons.

Three appendixes present historical data (1897–1984) on total union membership in the private and government sectors and a universe list of about 600 active and defunct labor organizations.

As the only current source of union membership and financial data under one cover, the *Union Sourcebook* clearly contains a wealth of data and information. Not all of it is without problems, some created by the lack of attention paid to copy editing and proofreading. There are annoying typographical errors, errors of omission and fact, awkward sentence structure, and unnecessary use of symbols in the abundant tabular material. In addition, the across-the-page type format, instead of a double-column format, makes reading quite difficult.

Affiliation of most labor organizations will probably be unknown to some of the book's potential users. To assist users in locating a specific organization, the authors should consider a more useful approach to the organizational structure in chapter 6 in their next edition of the *Sourcebook*. For example, an alphabetical listing of all organizations regardless of affiliation would more adequately do the job (affiliation could then be shown following the name of the organization). Also, the *Sourcebook* lacks complete name of labor organizations, a deficiency sure to be noticed by scholars and practitioners alike.

More serious are some factual errors. Table 3.71, showing historical membership data for selected years from 1897 to 1983 for labor organizations having 100,000 members or more in 1983, lists among its 41 organizations the Food and Commercial Workers (full name, United Food Commerical Workers, International Union, AFL-CIO). This union was formed on June 7, 1979, following the merger of the Retail Clerks International Union (AFL-CIO) and the Meat Cutters and Butcher Workmen of North America (AFL-CIO). Yet, historical membership data are shown for this union from 1939 through 1983. The authors offer no explanation for this, leaving the uninitiated to assume that the Food and Commercial Workers is an old line labor organization. Later, in appendix C, they place its startup date as 1897, that of the Meat Cutters union.

The *Sourcebook's* membership data represent the average annual dues-paying, full-time equivalent membership. The figures are not actual counts of union members but, for the most part, are derived from the annual per-capita revenues divided by the organization's per capita tax rate. These data are collected by the U.S. Department of Labor of all organizations required to file annual financial reports under the Labor Managment Reporting and Disclosure Act of 1959. This methodology, the authors say, provides a "consistent, objective basis for membership determination, free of reporting and interpretation problems." But, some questions remain

For example, when the Food and Commercial Workers was formed in 1979, it had a combined membership of 1.2 million. At that time, membership levels of the two merging unions and the newly formed organization were widely reported in the press—popular and trade, including the *AFL-CIO NEWS*. Yet, Troy and Sheflin report the union's membership at a much lower 892,000 for 1979. Similarly, the United Electrical, Radio, and Machine Workers of America (UE, Ind.) reported 162,000 members for the 1980 edition of the BLS *Union Directory* (which was never published because of budget constraints). The *Sourcebook* reports total UE membership for 1983 as 35,500, about equally divided between U.S. and Canadian unions. But, Boris Block, Secretary-Treasurer of the UE, calls the *Sourcebook* figures grossly understated. He says that the UE represents at General Electric and Westinghouse alone the *Sourcebook's* reported U.S. membership of about 17,500.

Unfortunately, the authors offer no explanation for the obviously large discrepancies between some of their figures and those previously published in other sources. The problem, however, is not pervasive and a random check of several other membership figures indicates comparability with those published by BLS for earlier years. Nevertheless, it is to be hoped that, in their next edition, the authors will address some of these more glaring differences.

A more intricate system of industrial relations

Industrial Relations in Britain. Edited by George Sayers Bain. Oxford, England, Besil Blackwell Publisher, 1983, 515 pp.

This volume of 17 chapters, edited by George Sayers Bain, presents an indepth description of British industrial relations in the 1980's. Each chapter is an original essay, written by an industrial relations expert from academia or the government on a specific aspect of the British system. The chapters are arranged in five sections: Trade Unions; Management; Patterns of Industrial Relations; The Labour Market; and The State and Its Agencies. The depth of coverage is fascinating in the clarity of the writing and comprehensive content, but somewhat tedious in the depth of minutae.

The American reader may be inclined to draw comparisons at all stages of the book's progression. One overall conclusion that might be made is that industrial relations is more complex in England than in the United States. There are about four times as many unions corresponding to U.S. international unions and twice as many federations. There is also much more decentralization of power within the unions, with a great amount of discretion exercised by shop stewards and local union committees.

The legislative enactments affecting industrial relations is ever changing. In all areas, from laws regulating unions to those regulating minimum wages, there has been a succession of separate acts of Parliament that cancel previous laws. Continuity is lacking as each change of government brings a dramatic shift in emphasis toward or away from the laboring classes. For example, Conservative Governments have enacted labor laws twice since 1960, then seen them emasculated and virtually eliminated by succeeding Labor Party governments.

The editor of this volume proposes that the book be used by students in undergraduate or graduate courses in industrial relations, industrial economics, labor law, or personnel management. His recommendation is, no doubt, entirely appropriate in British colleges and universities. However, in other countries, the volume would probably be more appropriate as a reference book. In that role, it is an excellent work to assist students in understanding the complexity of the British system.

NOTES ON CURRENT LABOR STATISTICS

This section of the Review presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force, employment, unemployment, collective bargaining settlements, consumer, producer, and international prices, productivity, international comparisons, and injury and illness statistics. In the notes that follow, the data in each group of tables is briefly described, key definitions are given, notes on the data are set forth, and sources of additional information are cited.

General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as "seasonally adjusted." (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. (Seasonally adjusted data appear in tables 1–3, 4–10, 13, 14, and 18.) Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X–11/ARIMA, which was developed at Statistics Canada as an extension of the standard X–11 method previously used by BLS. A detailed description of the procedure appears in *The X–11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada, Catalogue No. 12–564E, January 1983). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. However, revisions of historical data continue to be made only at the end of each calendar year.

Seasonally adjusted labor force data in tables 1 and 4–10 were revised in the February 1985 issue of the *Review* to reflect experience through 1984.

Annual revisions of the seasonally adjusted payroll data shown in tables 13, 14, and 18 were made in July 1985 using the X–11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in table 42 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data—such as the Hourly Earnings Index in table 17—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The $2 (or any other resulting values) are described as "real," "constant," or "1967" dollars.

Additional information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule preceding these general notes. More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in *Employment and Earnings*, a monthly publication of the Bureau. More data from the household survey is published in the two-volume data book—*Labor Force Statistics Derived From the Current Population Survey*, Bulletin 2096. More data from the establishment survey appear in two data books—*Employment, Hours, and Earnings, United States*, and *Employment, Hours, and Earnings, States and Areas*, and the annual supplements to these data books. More detailed information on employee compensation and collective bargaining settlements is published in the monthly periodical, *Current Wage Developments*. More detailed data on consumer and producer prices is published in the monthly periodicals, *The CPI Detailed Report*, and *Producer Prices and Price Indexes*. Detailed data on all of the series in this section are provided in the *Handbook of Labor Statistics*, which is published biennially by the Bureau. BLS bulletins are issued covering productivity, injury and illness, and other data in this section. Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

Symbols

p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally, this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.
n.e.s. = not elsewhere specified.

COMPARATIVE INDICATORS
(Tables 1–3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-to-population ratio, and unemployment rates for major demographic groups based on the Current Population ("household") Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonagricultural payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on changes in compensation, prices, and productivity are presented in table 2. Measures of rates of change of compensation and wages

from the Employment Cost Index program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; and the overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data. For detailed descriptions of each data series, see BLS *Handbook of Methods*, Volumes I and II, Bulletins 2134-1 and 2134-2 (Bureau of Labor Statistics, 1982 and 1984, respectively), as well as the additional bulletins, articles, and other publications noted in the separate sections of the *Review*'s "Current Labor Statistics Notes." Historical data for many series are provided in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). Users may also wish to consult *Major Programs, Bureau of Labor Statistics*, Report 718 (Bureau of Labor Statistics, 1985).

EMPLOYMENT DATA

(Tables 1; 4–21)

Household Survey Data

Description of the series

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 59,500 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons include (1) all civilians who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. Members of the Armed Forces stationed in the United States are also included in the employed total. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **overall unemployment rate** represents the number unemployed as a percent of the labor force, including the resident Armed Forces. The **civilian unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **labor force** consists of all employed or unemployed civilians plus members of the Armed Forces stationed in the United States. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons who are retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy, and members of the Armed Forces stationed in the United States. The **labor force participation rate** is the proportion of the noninstitutional population that is in the labor force. The **employment-population ratio** is total employment (including the resident Armed Forces) as a percent of the noninstitutional population.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 4–10 are seasonally adjusted, based on the seasonal experience through December 1984.

Additional sources of information

For detailed explanations of the data, see BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982) and for additional data, *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). A detailed description of the Current Population Survey as well as additional data are available in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*. Historical data from 1948 to 1982 are available in *Labor Force Statistics Derived from the Current Population Survey: A Databook*, Vols. I and II, Bulletin 2096 (Bureau of Labor Statistics, 1982).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Establishment Survey Data

Description of the series

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by more than 200,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday

and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 12-16 include production workers in manufacturing and mining; construction workers in construction; and for nonsupervisory workers in the following industries: transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for about four-fifths of the total employment on private nonagricutural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earner and Clerical Workers (CPI-W). The **Hourly Earning Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index, introduced in table 17 of the May 1983 issue, represents the percent of 185 nonagricultural industries in which employment was rising over the indicated period. One-half of the industries with unchanged employment are counted as rising. In line with Bureau practice, data for the 1-, 3-, and 6-month spans are seasonally adjusted, while those for the 12-month span are unadjusted. The diffusion index is useful for measuring the dispersion of economic gains or losses and is also an economic indicator.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of May 1985 data, published in the July 1985 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Unadjusted data have been revised back to April 1983; seasonally adjusted data have been revised back to January 1980. These revisions were published in the *Supplement to Employment and Earnings* (Bureau of Labor Statistics, 1985). Unadjusted data from April 1984 forward, and seasonally adjusted data from January 1981 forward are subject to revision in future benchmarks.

Additional sources of information

Detailed data from the establishment survey are published monthly in the BLS periodical, *Employment and Earnings*. Earlier comparable unadjusted and seasonally adjusted data are published in *Employment, Hours, and Earnings, United States, 1909–84*, Bulletin 1312–12 and its annual supplement (Bureau of Labor Statistics, 1985). For a detailed discussion of the methodology of the survey, see *BLS Handbook of Methods*, Bulletin 2143–1 (Bureau of Labor Statistics, 1982). For additional data, see *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Unemployment Data By State

Description of the series

Data presented in this section are obtained from two major sources—the Current Population Survey (CPS) and the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act and the Public Works and Economic Development Act. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

Notes on the data

Data refer to State of residence. Monthly data for 11 States—California, Florida, Illinois, Massachusetts, Michigan, New York, New Jersey, North Carolina, Ohio, Pennsylvania, and Texas—are obtained directly from the CPS because the size of the sample is large enough to meet BLS standards of reliability. Data for the remaining 39 States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates for the 11 States are revised to new population controls. For the remaining States and the District of Columbia, data are benchmarked to annual average CPS levels.

Additional sources of information

Information on the concepts, definitions, and technical procedures used to develop labor force data for States and sub-State areas as well as additional data on sub-States are provided in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*, and the annual report, *Geographic Profile of Employment and Unemployment* (Bureau of Labor Statistics). See also *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982).

COMPENSATION AND WAGE DATA

(Tables 22–29)

COMPENSATION AND WAGE DATA are gathered by the Bureau from business establishments, State and local governments, labor unions, collective bargaining agreements on file with the Bureau, and secondary sources.

Employment Cost Index

Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It uses a fixed market basket of labor—similar in concept to the Consumer Price Index's fixed market basket of goods and services—to measure change over time in employer costs of employing labor. The index is not seasonally adjusted.

Statistical series on total compensation costs and on wages and salaries are available for private nonfarm workers excluding proprietors, the self-employed, and household workers. Both series are also available for State and local government workers and for the civilian nonfarm economy, which consists of private industry and State and local government workers combined. Federal workers are excluded.

The Employment Cost Index probability sample consists of about 2,200 private nonfarm establishments providing about 12,000 occupational observations and 700 State and local government establishments providing

3,500 occupational observations selected to represent total employment in each sector. On average, each reporting unit provides wage and compensation information on five well-specified occupations. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Fixed employment weights from the 1970 Census of Population are used each quarter to calculate the indexes for civilian, private, and State and local governments. These fixed weights, also used to derive all of the industry and occupation series indexes, ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the bargaining status, region, and metropolitan/nonmetropolitan area series, however, employment data by industry and occupation are not available from the census. Instead, the 1970 employment weights are reallocated within these series each quarter based on the current sample. Therefore, these indexes are not strictly comparable to those for the aggregate, industry, and occupation series.

Definitions

Total compensation costs include wages, salaries, and the employer costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as social security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

Notes on the data

The Employment Cost Index data series began in the fourth quarter of 1975, with the quarterly percent change in wages and salaries in the private nonfarm sector. Data on employer costs for employee benefits were included in 1980 to produce, when combined with the wages and salaries series, a measure of the percent change in employer costs for employee total compensation. State and local government units were added to the ECI coverage in 1981, providing a measure of total compensation change in the *civilian* nonfarm economy (excluding Federal employees). Historical indexes (June 1981 = 100) of the quarterly rates of change are presented in the May issue of the BLS monthly periodical, *Current Wage Developments*.

Additional sources of information

For a more detailed discussion of the Employment Cost Index, see Chapter 11, "The Employment Cost Index," in the *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), and the following *Monthly Labor Review* articles: "Employment Cost Index: a measure of change in the 'price of labor'," July 1975; "How benefits will be incorporated into the Employment Cost Index," January 1978; "Estimation procedures for the Employment Cost Index," May 1982; and "Introducing new weights for the Employment Cost Index," June 1985.

Data on the ECI are also available in BLS quarterly press releases issued in the month following the reference months of March, June, September, and December; and from the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

Collective bargaining settlements

Description of the series

Collective bargaining settlements data provide statistical measures of negotiated adjustments (increases, decreases, and freezes) in compensation (wages and benefits costs) and wages alone, quarterly for private industry and semiannually for State and local government. Compensation measures cover all collective bargaining situations involving 5,000 workers or more and wage measures cover all situations involving 1,000 workers or more. These data, covering private nonagricultural industries and State and local governments, are calculated using information obtained from bargaining agreements on file with the Bureau, parties to the agreements, and secondary sources, such as newspaper accounts. The data are not seasonally adjusted.

Settlement data are measured in terms of future specified adjustments: those that will occur within 12 months after contract ratification—first year—and all adjustments that will occur over the life of the contract expressed as an average annual rate. Adjustments are worker weighted. Both first-year and over-the-life measures exclude wage changes that may occur under cost-of-living clauses that are triggered by future movements in the Consumer Price Index.

Effective wage adjustments measure all adjustments occurring in the reference period, regardless of the settlement date. Included are changes from settlements reached during the period, changes deferred from contracts negotiated in earlier periods, and changes under cost-of-living adjustment clauses. Each wage change is worker weighted. The changes are prorated over all workers under agreements during the reference period yielding the average adjustment.

Definitions

Wage rate changes are calculated by dividing newly negotiated wages by the average hourly earnings, excluding overtime, at the time the agreement is reached. Compensation changes are calculated by dividing the change in the value of the newly negotiated wage and benefit package by existing average hourly compensation, which includes the cost of previously negotiated benefits, legally required social insurance programs, and average hourly earnings.

Compensation changes are calculated by placing a value on the benefit portion of the settlements at the time they are reached. The cost estimates are based on the assumption that conditions existing at the time of settlement (for example, methods of financing pensions or composition of labor force) will remain constant. The data, therefore, are measures of negotiated changes and not of total changes in employer cost.

Contract duration runs from the effective date of the agreement to the expiration date or first wage reopening date, if applicable. Average annual percent changes over the contract term take account of the compounding of successive changes.

Notes on the data

Care should be exercised in comparing the size and nature of the settlements in State and local government with those in the private sector because of differences in bargaining practices and settlement characteristics. A principal difference is the incidence of cost-of-living adjustment (COLA) clauses which cover only about 2 percent of workers under a few local government settlements but cover 50 percent of workers under private sector settlements. Agreements without COLA's tend to provide larger specified wage increases than those with COLA's. Another difference is that State and local government bargaining frequently excludes pension benefits which are often prescribed by law. In the private sector, in contrast, pensions are typically a bargaining issue.

Additional sources of information

For a more detailed discussion on the series, see chapter 10, "Negotiated Wage and Benefit Changes," of the BLS *Handbook of Methods*, Bulletin 2134–1. Comprehensive data are published in press releases issued quarterly (in January, April, July, and October) for private industry, and semi-

annually (in February and August) for State and local government. Historical data and additional detailed tabulations for the prior calendar year appear in the April issue of the BLS monthly periodical, *Current Wage Developments*.

Work stoppages

Description of the series

Data on work stoppages measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of time lost because of stoppage.

Data are largely from newspaper accounts and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate number of work days lost by workers involved in the stoppages.

Days of idleness as a percent of estimated working time: Aggregate work days lost as a percent of the aggregate number of standard work days in the period multiplied by total employment in the period.

Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

Additional sources of information

Data for each calendar year are reported in a BLS press release issued in the first quarter of the following year. Monthly data appear in the BLS monthly periodical, *Current Wage Developments*. Historical data appear in the BLS *Handbook of Labor Statistics*.

Other compensation data

Other BLS data on pay and benefits, not included in the Current Labor Statistics section of the *Monthly Labor Review*, appear in and consist of the following:

Industry Wage Surveys provide data for specific occupations selected to represent an industry's wage structure and the types of activities performed by its workers. The Bureau collects information on weekly work schedules, shift operations and pay differentials, paid holiday and vacation practices, and information on incidence of health, insurance, and retirement plans. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Monthly Labor Review*.

Area Wage Surveys annually provide data for selected office, clerical, professional, technical, maintenance, toolroom, powerplant, material movement, and custodial occupations common to a wide variety of industries in the areas (labor markets) surveyed. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Review*.

The National Survey of Professional, Administrative, Technical, and Clerical Pay provides detailed information annually on salary levels and distributions for the types of jobs mentioned in the survey's title in private employment. Although the definitions of the jobs surveyed reflect the duties and responsibilities in private industry, they are designed to match specific pay grades of Federal white-collar employees under the General Schedule pay system. Accordingly, this survey provides the legally required information for comparing the pay of salaried employees in the Federal civil service with pay in private industry. (See Federal Pay Comparability Act of 1970, 5 U.S.C. 5305.) Data are published in a BLS news release issued in the summer and in a bulletin each fall; summaries and analytical articles also appear in the *Review*.

Employee Benefits Survey provides nationwide information on the incidence and characteristics of employee benefit plans in medium and large establishments in the United States, excluding Alaska and Hawaii. Data are published in an annual BLS news release and bulletin, as well as in special articles appearing in the *Review*.

PRICE DATA
(Tables 30–41)

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Consumer Price Indexes

Description of the series

The Consumer Price Index (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all urban consumer index (CPI-U) introduced in 1978 is representative of the 1972–73 buying habits of about 80 percent of the noninstitutional population of the United States at that time, compared with 40 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 24,000 retail establishments and 24,000 tenants in 85 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 28 major urban centers are presented in table 31. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are measured for the CPI-U. A rental equivalence method replaced the

asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes.

Additional sources of information

For a discussion of the general method for computing the CPI, see *BLS Handbook of Methods, Volume II, The Consumer Price Index*, Bulletin 2134–2 (Bureau of Labor Statistics, April 1984). The recent change in the measurement of homeownership costs is discussed in Robert Gillingham and Walter Lane, "Changing the treatment of shelter costs for homeowners in the CPI," *Monthly Labor Review*, June 1982, pp. 9–14.

Additional detailed CPI data and regular analyses of consumer price changes are provided in the *CPI Detailed Report*, a monthly publication of the Bureau. Historical data for the overall CPI and for selected groupings may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

Producer Price Indexes

Description of the series

Producer Price Indexes (PPI) measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 60,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The stage of processing structure of Producer Price Indexes organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1976, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

Notes on the data

Beginning with the January 1986 issue, the *Review* is no longer presenting tables of Producer Price Indexes for commodity groupings, special composite groups, or SIC industries. However, these data will continue to be presented in the Bureau's monthly publication *Producer Price Indexes*. Series on the net output of major mining and manufacturing industry groups will appear in the *Review* starting with data for July 1986.

The Bureau has completed the first major stage of its comprehensive overhaul of the theory, methods, and procedures used to construct the Producer Price Indexes. Changes include the replacement of judgment sampling with probability sampling techniques; expansion to systematic coverage of the net output of virtually all industries in the mining and manufacturing sectors; a shift from a commodity to an industry orientation; the exclusion of imports from, and the inclusion of exports in, the survey universe; and the respecification of commodities priced to conform to Bureau of the Census definitions. These and other changes have been phased in gradually since 1978. The result is a system of indexes that is easier to use in conjunction with data on wages, productivity, and employment and other series that are organized in terms of the Standard Industrial Classification and the Census product class designations.

Additional sources of information

For a discussion of the methodology for computing Producer Price Indexes, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 7.

Additional detailed data and analyses of price changes are provided monthly in *Producer Price Indexes*. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

International Price Indexes

Description of the series

The BLS **International Price Program** produces quarterly export and import price indexes for nonmilitary goods traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts: it includes corporations, businesses, and individuals but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents. With publication of an all-import index in February 1983 and an all-export index in February 1984, all U.S. merchandise imports and exports now are represented in these indexes. The reference period for the indexes is 1977 = 100, unless otherwise indicated.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected quarterly by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S. border for imports. For nearly all products, the prices refer to transactions completed during the first 2 weeks of the third month of each calendar quarter—March, June, September, and December. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined by the 4- and 5-digit level of detail of the Standard Industrial Trade Classification System (SITC). The calculation of indexes by SITC category facilitates the comparison of U.S. price trends and sector production with similar data for other countries. Detailed indexes are also computed and published on a Standard Industrial Classification (SIC-based) basis, as well as by end-use class.

Notes on the data

The export and import price indexes are weighted indexes of the Laspeyeres type. Price relatives are assigned equal importance within each weight category and are then aggregated to the SITC level. The values assigned to each weight category are based on trade value figures compiled

by the Bureau of the Census. The trade weights currently used to compute both indexes relate to 1980.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's quarterly questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

For the export price indexes, the preferred pricing basis is f.a.s. (free alongside ship) U.S. port of exportation. When firms report export prices f.o.b. (free on board), production point information is collected which enables the Bureau to calculate a shipment cost to the port of exportation. An attempt is made to collect two prices for imports. The first is the import price f.o.b. at the foreign port of exportation, which is consistent with the basis for valuation of imports in the national accounts. The second is the import price c.i.f. (cost, insurance, and freight) at the U.S. port of importation, which also includes the other costs associated with bringing the product to the U.S. border. It does not, however, include duty charges.

Additional sources of information

For a discussion of the general method of computing International Price Indexes, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 8.

Additional detailed data and analyses of international price developments are presented in the Bureau's quarterly publication *U.S. Import and Export Price Indexes* and in occasional *Monthly Labor Review* articles prepared by BLS analysts. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

PRODUCTIVITY DATA
(Tables 42–47)

U. S. productivity and related data

Description of the series

The productivity measures relate real physical output to real input. As such they encompass a family of measures which include single factor input measures, such as output per unit of labor input (output per hour) or output per unit of capital input, as well as measures of multifactor productivity (output per unit of labor and capital inputs combined). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

Definitions

Output per hour of all persons (labor productivity) is the value of goods and services in constant prices produced per hour of labor input. **Output per unit of capital services** (capital productivity) is the value of goods and services in constant dollars produced per unit of capital services input.

Multifactor productivity is the ratio output per unit of labor and capital inputs combined. Changes in this measure reflect changes in a number of factors which affect the production process such as changes in technology, shifts in the composition of the labor force, changes in capacity utilization, research and development, skill and efforts of the work force, management, and so forth. Changes in the output per hour measures reflect the impact of these factors as well as the substitution of capital for labor.

Compensation per hour is the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, and the wages, salaries, and supplementary payments for the self-employed (except for nonfinancial corporations in which there are no self-employed)—the sum divided by hours paid for. **Real compensation per hour** is compensation per hour by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs is the labor compensation costs expended in the production of a unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current dollar value of output and dividing by output. **Unit nonlabor costs** contain all the components of unit nonlabor payments *except* unit profits.

Unit profits include corporate profits and the value of inventory adjustments per unit of output.

Hours of all persons are the total hours paid of payroll workers, self-employed persons, and unpaid family workers.

Capital services is the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories—weighted by rental prices for each type of asset.

Labor and capital inputs combined are derived by combining changes in labor and capital inputs with weights which represent each component's share of total output. The indexes for capital services and combined units of labor and capital are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

Notes on the data

Output measures for the business sector and the nonfarm businesss sector exclude the constant dollar value of owner-occupied housing, rest of world, households and institutions, and general government output from the constant dollar value of gross national product. The measures are derived from data supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are developed from data of the Bureau of Labor Statistics and the Bureau of Economic Analysis.

The productivity and associated cost measures in tables 42–44 describe the relationship between output in real terms and the labor time and capital services involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input. Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and efforts of the work force.

Additional sources of information

Descriptions of methodology underlying the measurement of output per hour and multifactor productivity are found in the *BLS Handbook of Methods*, Bulletin 2134, Vol. 1, Chapter 13 (Bureau of Labor Statistics, 1982). Historical data for selected industries are provided in the Bureau's *Handbook of Labor Statistics*, Bulletin 2217, 1985.

International comparisons

Description of the series

Comparative measures of labor force, employment, and unemployment (tables 45 and 46) are prepared regularly for the United States, Canada, Australia, Japan, France, Germany, Great Britain, Italy, the Netherlands, and Sweden. Unemployment rates, approximating U.S. concepts, are prepared monthly for most of the countries; the other measures, annually.

The Bureau of Labor Statistics also prepares international comparisons of manufacturing labor productivity and labor costs (table 47) that cover the United States and 11 foreign countries—those listed above plus Belgium and Norway. These measures are limited to trend comparisons; that is, intercountry series of changes over time, rather than level comparisons because reliable international comparisons of the levels of manufacturing are unavailable. The U.S. measures are described in the notes on U.S. productivity measurement; the measures for foreign countries are compiled from various national and international data sources.

Definitions

Output measures are constant value output (value added) from the national accounts of each country, except for those for Japan prior to 1970 and for the Netherlands for 1969 forward, which are indexes of industrial production. The national accounting methods for measuring real output differ considerably among the 12 countries, but the use of different procedures does not, in itself, connote lack of comparability—rather, it reflects differences among countries in the availability and reliability of underlying data series.

Hours and compensation measures refer to all employed persons including the self-employed in the United States and Canada, and to all wage and salary employees in the other countries. *Hours* refer to hours *paid* in the United States, hours *worked* in the other countries. *Compensation (labor costs)* includes not only all payments made directly to employees and employer expenditures for social insurance and private benefit plans, but changes in significant employment or payroll taxes that are not compensation to employees but are labor costs to employers (France, Sweden, and the United Kingdom). Self-employed workers are included in the U.S. and Canadian figures by assuming that their hourly compensation is equal to the average for wage and salary employees.

Notes on the data

The data for the foreign countries in tables 45 and 46 have been adjusted, where necessary, for greater comparability with U.S. definitions of employment and unemployment. The adjusted statistics have been adapted to the age at which compulsory schooling ends in each country. Therefore, the adjusted statistics relate to the civilian population age 16 and over in the United States, France, and Sweden, and from 1973 onward, Great Britain; 15 and over in Canada, Australia, Japan, Germany, and the Netherlands; and 14 and over in Italy. Prior to 1973, the data for Great Britain related to persons age 15 and over. The institutional population is included in the denominator of the labor force participation rates and employment-population rates for Japan and Germany.

For most of the countries in table 47, the measures refer to total manufacturing as defined by the International Standard Industrial Classification. However, the measures for France (beginning 1959), Italy (beginning 1970), and the United Kingdom (beginning 1976) refer to manufacturing and mining less energy-related products. For all countries, manufacturing includes the activities of government enterprises.

In addition, for all countries, preliminary estimates for recent years are generally based on current indicators of manufacturing output, employment and hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

Additional sources of information

For further information, see *International Comparisons of Unemployment*, Bulletin 1979 (Bureau of Labor Statistics, 1978), Appendix B and Supplements to Appendix B. Additional detail is also found in the BLS *Handbook of Methods*, Bulletin 2134, Vol. 1, Chapter 16. Additional international comparison statistics are available in the *Handbook of Labor Statistics* (BLS Bulletin 2217, 1985). The most recent statistics are presented and analyzed annually in the *Monthly Labor Review*, typically in the December issue (for the previous year) and in February.

OCCUPATIONAL INJURY AND ILLNESS DATA

(Table 48)

Description of the series

The Annual Survey of Occupational Injuries and Illnesses is designed to collect data on injuries and illnesses based on records which employers in the following industries maintain under the Occupational Safety and Health Act of 1970: agriculture, forestry, and fishing; oil and gas extraction; construction; manufacturing; transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. Excluded from the survey are self-employed individuals, farmers with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies.

Because the survey is a Federal–State cooperative program and the data must meet the needs of participating State agencies, an independent sample is selected for each State. The sample is selected to represent all private industries in the States and territories. The sample size for the survey is dependent upon (1) the characteristics for which estimates are needed; (2) the industries for which estimates are desired; (3) the characteristics of the population being sampled; (4) the target reliability of the estimates; and (5) the survey design employed.

While there are many characteristics upon which the sample design could be based, the total recorded case incidence rate is used because it is one of the most important characteristics and the least variable; therefore, it requires the smallest sample size.

The survey is based on stratified random sampling with a Neyman allocation and a ratio estimator. The characteristics used to stratify the establishments are the Standard Industrial Classification (SIC) code and size of employment.

Definitions

Recordable occupational injuries and illnesses are: (1) occupational deaths, regardless of the time between injury and death, or the length of the illness; or (2) nonfatal occupational illnesses; or (3) nonfatal occupational injuries which involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment (other than first aid).

Occupational injury is any injury such as a cut, fracture, sprain, amputation, etc., which results from a work accident or from exposure involving a single incident in the work environment.

Occupational illness is an abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday cases are cases which involve days away from work, or days of restricted work activity, or both.

Lost workday cases involving restricted work activity are those cases which result in restricted work activity only.

Lost workdays away from work are the number of workdays (consecutive or not) on which the employee would have worked but could not

because of occupational injury or illness.

Lost workdays—restricted work activity are the number of workdays (consecutive or not) on which, because of injury or illness: (1) the employee was assigned to another job on a temporary basis; or (2) the employee worked at a permanent job less than full time; or (3) the employee worked at a permanently assigned job but could not perform all duties normally connected with it.

The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked even though able to work.

Incidence rates represent the number of injuries and/or illnesses or lost workdays per 100 full-time workers.

Notes on the data

Estimates are made for industries and employment-size classes and for severity classification: fatalities, lost workday cases, and nonfatal cases without lost workdays. Lost workday cases are separated into those where the employee would have worked but could not and those in which work activity was restricted. Estimates of the number of cases and the number of days lost are made for both categories.

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses, or lost workdays, per 100 full-time employees. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Only a few of the available measures are included in the *Handbook of Labor Statistics*. Full detail is presented in the annual bulletin, *Occupational Injuries and Illnesses in the United States, by Industry*.

Comparable data for individual States are available from the BLS Office of Occupational Safety and Health Statistics.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration, respectively. Data from these organizations are included in BLS and State publications. Federal employee experience is compiled and published by the Occupational Safety and Health Administration. Data on State and local government employees are collected by about half of the States and territories; these data are not compiled nationally.

Additional sources of information

The Supplementary Data System provides detailed information describing various factors associated with work-related injuries and illnesses. These data are obtained from information reported by *employers* to State workers' compensation agencies. The Work Injury Report program examines selected types of accidents through an employee survey which focuses on the circumstances surrounding the injury. These data are not included in the *Handbook of Labor Statistics* but are available from the BLS Office of Occupational Safety and Health Statistics.

The definitions of occupational injuries and illnesses and lost workdays are from *Recordkeeping Requirements under the Occupational Safety and Health Act of 1970*. For additional data, see *Occupational Injuries and Illnesses in the United States, by Industry*, annual Bureau of Labor Statistics bulletin; BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), ch. 17; *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985), pp. 411–14; annual reports in the *Monthly Labor Review*; and annual U.S. Department of Labor press releases.

20. Annual data: Employment levels by industry

(Number in thousands)

Industry	1976	1977	1978	1979	1980	1981	1982	1983	1984
Total employment	79,382	82,471	86,697	89,823	90,406	91,156	89,566	90,196	94,461
Private sector	64,511	67,344	71,026	73,876	74,166	75,126	73,729	74,330	78,477
Goods-producing	23,352	24,346	25,585	26,461	25,658	25,497	23,813	23,334	24,730
Mining	779	813	851	958	1,027	1,139	1,128	952	974
Construction	3,576	3,851	4,229	4,463	4,346	4,188	3,905	3,948	4,345
Manufacturing	18,997	19,682	20,505	21,040	20,285	20,170	18,781	18,434	19,412
Service-producing	56,030	58,125	61,113	63,363	64,748	65,659	65,753	66,862	69,731
Transportation and public utilities	4,582	4,713	4,923	5,136	5,146	5,165	5,082	4,954	5,171
Wholesale trade	4,546	4,708	4,969	5,204	5,275	5,358	5,278	5,268	5,550
Retail trade	13,209	13,808	14,573	14,989	15,035	15,189	15,179	15,613	16,584
Finance, insurance, and real estate	4,271	4,467	4,724	4,975	5,160	5,298	5,341	5,468	5,682
Services	14,551	15,303	16,252	17,112	17,890	18,619	19,036	19,694	20,761
Government	14,871	15,127	15,672	15,947	16,241	16,031	15,837	15,869	15,984
Federal	2,733	2,727	2,753	2,773	2,866	2,772	2,739	2,774	2,807
State	3,273	3,377	3,474	3,541	3,610	3,640	3,640	3,662	3,712
Local	8,865	9,023	9,446	9,633	9,765	9,619	9,458	9,434	9,465

NOTE: Data include Alaska and Hawaii beginning in 1959. See "Notes on the data" for a description of the most recent benchmark revision.

21. Annual data: Average hours and earnings of production or nonsupervisory workers on nonagricultural payrolls, by industry

Industry	1976	1977	1978	1979	1980	1981	1982	1983	1984
Private sector									
Average weekly hours	36.1	36.0	35.8	35.7	35.3	35.2	34.8	35.0	35.3
Average hourly earnings	4.86	5.25	5.69	6.16	6.66	7.25	7.68	8.02	8.33
Average weekly earnings	175.45	189.00	203.70	219.91	235.10	255.20	267.26	280.70	294.05
Mining									
Average weekly hours	42.4	43.4	43.4	43.0	43.3	43.7	42.7	42.5	43.3
Average hourly earnings	6.46	6.94	7.67	8.49	9.17	10.04	10.77	11.28	11.63
Average weekly earnings	273.90	301.20	332.88	365.07	397.06	438.75	459.88	479.40	503.58
Construction									
Average weekly hours	36.8	36.5	36.8	37.0	37.0	36.9	36.7	37.1	37.7
Average hourly earnings	7.71	8.10	8.66	9.27	9.94	10.82	11.63	11.94	12.12
Average weekly earnings	283.73	295.65	318.69	342.99	367.78	399.26	426.82	442.97	456.92
Manufacturing									
Average weekly hours	40.1	40.3	40.4	40.2	39.7	39.8	38.9	40.1	40.7
Average hourly earnings	5.22	5.68	6.17	6.70	7.27	7.99	8.49	8.83	9.18
Average weekly earnings	209.32	228.90	249.27	269.34	288.62	318.00	330.26	354.08	373.63
Transportation and public utilities									
Average weekly hours	39.8	39.9	40.0	39.9	39.6	39.4	39.0	39.0	39.4
Average hourly earnings	6.45	6.99	7.57	8.16	8.87	9.70	10.32	10.79	11.11
Average weekly earnings	256.71	278.90	302.80	325.58	351.25	382.18	402.48	420.81	437.73
Wholesale trade									
Average weekly hours	38.7	38.8	38.8	38.8	38.5	38.5	38.3	38.5	38.6
Average hourly earnings	5.03	5.39	5.88	6.39	6.96	7.56	8.09	8.55	8.96
Average weekly earnings	194.66	209.13	228.14	247.93	267.96	291.06	309.85	329.18	345.86

[1] The indexes are calculated differently from those for the occupation and industry groups. For a detailed description of the index calculation, see the Monthly Labor Review Technical Note, "Estimation procedures for the Employment Cost Index," May 1982.

25. Specified compensation and wage adjustments from contract settlements, and effective wage adjustments, private industry collective bargaining situations covering 1,000 workers or more (in percent)

Measure	Annual average		Quarterly average							
	1983	1984	1983	1984				1985		
			IV	I	II	III	IV	I[p]	II[p]	III[p]
Specified adjustments:										
Total compensation[1] adjustments,[2] settlements covering 5,000 workers or more:										
First year of contract	3.4	3.6	4.9	5.1	3.5	2.7	3.7	4.4	3.5	1.7
Annual rate over life of contract	3.0	2.8	3.1	4.7	3.2	3.1	2.0	4.0	3.5	2.9
Wage adjustments, settlements covering 1,000 workers or more:										
First year of contract	2.6	2.4	4.2	2.8	2.6	2.1	2.3	3.4	2.5	1.7
Annual rate over life of contract	2.8	2.4	2.8	3.3	2.7	2.6	1.5	3.2	2.9	2.9
Effective adjustments:										
Total effective wage adjustment[3]	4.0	3.7	1.1	.9	.9	1.2	.7	.7	.8	1.2
From settlements reached in period	.8	.8	.6	.1	.1	.2	.3	.1	.2	.2
Deferred from settlements reached in earlier periods	2.5	2.0	.3	.4	.7	.7	.2	.6	.5	.6
From cost-of-living-adjustments clauses	.6	.9	.2	.3	.2	.3	.2	.1	.1	.4

[1] Compensation includes wages, salaries, and employers' cost of employee benefits when contract is negotiated.

[2] Adjustments are the net result of increases, decreases and no changes in compensation or wages.

[3] Because of rounding total may not equal sum of parts.

p = preliminary.

26. Average specified compensation and wage adjustments, major collective bargaining settlements in private industry situations covering 1,000 workers or more during 4-quarter periods (in percent)

Measure	Average for four quarters ending–							
	1983	1984				1985		
	IV	I	II	III	IV	I[p]	II[p]	III[p]
Specified total compensation adjustments, settlements covering 5,000 workers or more, all industries:								
First year of contract	3.4	4.8	4.7	4.2	3.6	3.4	3.5	3.1
Annual rate over life of contract	3.0	3.6	3.5	3.2	2.8	2.7	2.8	2.8
Specified wage adjustments, settlements covering 1,000 workers or more:								
All industries								
First year of contract	2.6	3.5	3.5	3.2	2.4	2.4	2.4	2.3
Contracts with COLA clauses	1.9	4.0	4.6	4.5	2.9	2.5	2.3	2.0

Contracts without COLA clauses	2.6	2.2	1.8	1.4	1.0	1.4	1.7	(1)

[1] Data do not meet publication standards.

[p] = preliminary.

27. Average effective wage adjustments, private industry collective bargaining situations covering 1,000 workers or more during 4-quarter periods (in percent)

Effective wage adjustment	Average for four quarters ending–						
	1984				1985		
	I	II	III	IV	I[p]	II[p]	III[p]
For all workers:[1]							
Total	4.7	4.3	4.2	3.7	3.6	3.5	3.4
From settlements reached in period	1.2	1.0	1.0	.8	.7	.9	.8
Deferred from settlements reached in earlier period	2.5	2.2	2.1	2.0	2.2	1.9	1.8
From cost-of-living-adjustments clauses	1.0	1.1	1.2	.9	.7	.7	.8
For workers receiving changes:							
Total	5.5	5.3	5.0	4.4	4.5	4.2	4.3
From settlements reached in period	4.2	3.6	3.7	3.0	2.9	2.9	2.8
Deferred from settlements reached in earlier period	5.5	4.9	4.2	4.0	4.2	3.9	3.7
From cost-of-living-adjustments clauses	3.6	4.0	3.2	2.7	2.3	2.3	2.8

[1] Because of rounding total may not equal sum of parts.

[p] = preliminary.

28. Specified compensation and wage adjustments from contract settlements, and effective wage adjustments, State and local government collective bargaining situations covering 1,000 workers or more (in percent)

Measure	Annual average		First 6 months 1985[p]
	1983	1984	
Specified adjustments:			
Total compensation [1] adjustments, [2] settlements covering 5,000 workers or more:			
First year of contract	4.6	5.2	4.7
Annual rate over life of contract	5.2	5.4	4.9
Wage adjustments, settlements covering 1,000 workers or more:			
First year of contract	-	4.8	4.9
Annual rate over life of contract	-	5.1	5.1
Effective adjustments:			
Total effective wage adjustment [3]	-	5.0	1.6
From settlements reached in period	-	1.9	.9
Deferred from settlements reached in earlier periods	-	3.1	.8
From cost-of-living-adjustment clauses	-	.0	(4)

[1] Compensation includes wages, salaries, and employers' cost of employee benefits when contract is negotiated.

[2] Adjustments are the net result of increases, decreases and no changes in compensation or wages.

[3] Because of rounding total may not equal sum of parts.

[4] Less than 0.05 percent

- Data not available.

p = preliminary.

29. Work stoppages involving 1,000 workers or more

Measure	Annual totals		1984		1985										
	1983	1984	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June[p]	July[p]	Aug.[p]	Sept.[p]	Oct.[p]	Nov.[p]
Number of stoppages:															
Beginning in period	81	62	4	3	2	4	4	3	2	2	9	6	11	4	2
In effect during period	83	68	15	13	9	13	12	8	8	8	13	18	20	18	11
Workers involved:															
Beginning in period (in thousands)	909.0	376.0	12.0	42.5	4.7	29.3	15.2	6.2	6.9	15.7	52.3	15.3	69.5	74.6	25.0
In effect during period (in thousands)	945.0	391.0	32.3	59.0	16.0	43.9	46.2	14.1	14.8	28.5	60.2	66.8	93.9	117.3	64.6
Days idle:															
Number (in thousands)	17,461.0	8,499.0	500.1	655.8	278.3	259.3	696.5	229.5	203.3	454.3	500.2	869.7	931.4	1,433.0	651.2
Percent of estimated working time[1]	.08	.04	.03	.04	.01	.01	.03	.01	.01	.02	.02	.03	.04	.06	.03

[1] Agricultural and government employees are included in the total employed and total working time: private household, forestry, and fishery employees are excluded. An explanation of the measurement of idleness as a percentage of the total time worked is found in "Total Economy' Measure of Strike Idleness," Monthly Labor Review, October 1968, pp. 54-56.

p = preliminary.

30. Consumer Price Index for All Urban Consumers: U.S. city average, by expenditure category and commodity service group; and CPI for urban wage earners and clerical workers, All items

[1] Area is generally the Standard Metropolitan Statistical Area (SMSA), exclusive of farms. L.A.-Long Beach, Anaheim, Calif. is a combination of two SMSA's, and N.Y., N.Y.-Northeastern N.J. and Chicago, Ill.-Northwestern Ind. are the more extensive Standard Consolidated Areas. Area definitions are those established by the Office of Management and Budget in 1973, except for Denver-Boulder, Colo. which does not include Douglas County. Definitions do not include revisions made since 1973.

[2] Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

M - Every month.
1 - January, March, May, July, September, and November.
2 - February, April, June, August, October, and December.

[3] Regions are defined as the four Census regions.

The population size classes are aggregations of areas which have urban population as defined:

A-1 - More than 4,000,000.
A-2 - 1,250,000 to 4,000,000.
B - 385,000 to 1,250,000
C - 75,000 to 385,000.
D - Less than 75,000.

Population size class A is the aggregation of population size classes A-1 and A-2.

- Data not available.

NOTE: Local area CPI indexes are by-products of the national CPI program. Because each local index is a small subset of the national index, it has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error than the national index. As a result, local area indexes show greater volatility than the national index, although their long-term trends are quite similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in escalator clauses.

[1] Quarterly rates are for the first month of the quarter.

[2] Major changes in the Italian labor force survey, introduced in 1977, resulted in a large increase in persons enumerated as unemployed. However, many persons reported that they had not actively sought work in the past 30 days, and they have been provisionally excluded for comparability with U.S. concepts. Inclusion of such persons would more than double the Italian unemployment rate shown.

- Data not available.

NOTE: Quarterly and monthly figures for France, Germany, and Great Britain are calculated by applying annual adjustment factors to current published data and therefore should be viewed as less precise indicators of unemployment under U.S. concepts than the annual figures.

48. Annual data: Employment status of the civilian working-age population, ten countries

48. Occupational injury and illness incidence rates by industry, United States

Industry and type of case[1]	Incidence rates per 100 full-time workers[2]								
	1976	1977	1978	1979	1980	1981	1982	1983	1984
PRIVATE SECTOR[3]									
Total cases	-	-	-	-	-	8.3	7.7	7.6	8.0
Lost workday cases	-	-	-	-	-	3.8	3.5	3.4	3.7
Lost workdays	-	-	-	-	-	61.7	58.7	58.5	63.4
Agriculture, forestry, and fishing[3]									
Total cases	-	-	-	-	-	12.3	11.8	11.9	12.0
Lost workday cases	-	-	-	-	-	5.9	5.9	6.1	6.1
Lost workdays	-	-	-	-	-	82.8	86.0	90.8	90.7
Mining									
Total cases	-	-	-	-	-	11.6	10.5	8.4	9.7
Lost workday cases	-	-	-	-	-	6.2	5.4	4.5	5.3
Lost workdays	-	-	-	-	-	146.4	137.3	125.1	160.2
Construction									
Total cases	-	-	-	-	-	15.1	14.6	14.8	15.5
Lost workday cases	-	-	-	-	-	6.3	6.0	6.3	6.9
Lost workdays	-	-	-	-	-	113.1	115.7	118.2	128.1
General building contractors:									
Total cases	-	-	-	-	-	15.1	14.1	14.4	15.4
Lost workday cases	-	-	-	-	-	6.1	5.9	6.2	6.9
Lost workdays	-	-	-	-	-	107.1	112.0	113.0	121.3
Heavy construction contractors:									
Total cases	-	-	-	-	-	14.9	15.1	15.4	14.9
Lost workday cases	-	-	-	-	-	6.0	5.8	6.2	6.4
Lost workdays	-	-	-	-	-	106.0	113.1	122.4	131.7
Special trade contractors:									
Total cases	-	-	-	-	-	15.2	14.7	14.8	15.8
Lost workday cases	-	-	-	-	-	6.6	6.2	6.4	7.1
Lost workdays	-	-	-	-	-	119.3	118.6	119.0	130.1
Manufacturing									
Total cases	-	-	-	-	-	11.5	10.2	10.0	10.6
Lost workday cases	-	-	-	-	-	5.1	4.4	4.3	4.7
Lost workdays	-	-	-	-	-	82.0	75.0	73.5	77.9
Durable goods									
Lumber and wood products:									
Total cases	-	-	-	-	-	17.6	16.9	18.3	19.6
Lost workday cases	-	-	-	-	-	9.0	8.3	9.2	9.9
Lost workdays	-	-	-	-	-	158.4	153.3	163.5	172.0
Furniture and fixtures:									
Total cases	-	-	-	-	-	15.1	13.9	14.1	15.3
Lost workday cases	-	-	-	-	-	6.2	5.5	5.7	6.4
Lost workdays	-	-	-	-	-	91.9	85.6	83.0	101.5
Stone, clay, and glass products:									
Total cases	-	-	-	-	-	14.1	13.0	13.1	13.6
Lost workday cases	-	-	-	-	-	6.9	6.1	6.0	6.6
Lost workdays	-	-	-	-	-	122.2	112.2	112.0	120.8
Primary metal industries:									
Total cases	-	-	-	-	-	14.4	12.4	12.4	13.3
Lost workday cases	-	-	-	-	-	6.7	5.4	5.4	6.1

[1] Total cases include fatalities.

[2] The incidence rates represent the number of injuries and illnesses or lost workdays per 100 full-time workers and were calculated as: (N/EH) X 200,000, where:

N = number of injuries and illnesses or lost workdays.

EH = total hours worked by all employees during calendar year.

200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year.)

[3] Excludes farms with fewer than 11 employees since 1976.

SALES PUBLICATIONS

Area Wage Surveys

These bulletins cover office, professional, technical, maintenance, custodial, and material movement jobs in major metropolitan areas. The annual series of 70 is available by subscription for $102 per year. Individual area bulletins are also available separately. Published in November were:

Albany—Schenectady—Troy, New York, Metropolitan Area, September 1985. Bulletin 3030-44, 29 pp., $1.25 (GPO Stock No. 829-001-00044-6).

Cleveland, Ohio, Metropolitan Area, September 1985. Bulletin 3030-45, 39 pp., $1.75 (GPO Stock No. 829-001-00045-4).

Poughkeepsie, New York, Metropolitan Area, September 1985. Bulletin 3030-43, 22 pp., $1 (GPO Stock No.829-001-00043-1).

Periodicals

CPI Detailed Report. The September issue provides a comprehensive report on price movements for the month, plus statistical tables, charts, and technical notes. 77 pp., $4 ($25 per year).

Current Wage Developments. The October issue includes selected wage and benefit changes, work stoppages in September 1985, major agreements expiring in November, and statistics on compensation changes. 50 pp., $2 ($21 per year).

Employment and Earnings. The November issue covers employment and unemployment developments in October, plus regular statistical tables on national, State, and area employment, hours, and earnings. 143 pp., $4.50 ($31 per year).

Occupational Outlook Quarterly. The Fall issue features articles on intelligence, workers, archivists and curators, counselors, adult and vocational teachers, gem cutters; and the shrinking middle class. 36 pp., $3 ($11 per year).

Producer Price Indexes. The September issue includes a comprehensive report on price movements for the month, plus regular tables and technical notes. 179 pp., $4.25 ($29 per year).

U.S. Department of State Indexes of Living Costs Abroad, Quarters Allowances, and Hardship Differentials. October 1985. Tabulations computed quarterly by the Department of States for use in establishing allowances to compensate American civilian government employees for costs and hardships related to assignments abroad. The information is also used by many business firms and private organizations to assist in establishing private compensation systems. 8 pp., $2.75 ($10 per year).

Labor Month In Review

SEX SEGREGATION. The National Academy of Sciences published a study examining the cause, the extent, and the future direction of sex segregation in the workplace. The study, sponsored by the U.S. Departments of Labor and Education and the Carnegie Corporation, was conducted for the Academy by a 14-member committee of academic and business experts, chaired by Alice S. Ilchman, president of Sarah Lawrence College. Excerpts:

Measuring sex segregation. During the past decade, women's occupational options have unquestionably expanded. Their participation has increased sharply in several occupations previously predominantly male by tradition or policy: for example, lawyers, bank managers, insurance adjusters, postal clerks, bus drivers, and janitors, among others. In other occupations, women's representation is small but increasing rapidly, for example: coal miners, police officers, and engineers. The overall index of occupational sex segregation declined by nearly 10 percent between 1972 and 1981, more than it had during any previous decade in this century. Much of this decline was due to women's increased participation in many occupations that were 20 to 60 percent female in 1970 as well as to the decline in the size of some female-dominated occupations, rather than to the entry of women (or men) into the most atypical jobs for their sex.

Nevertheless, sex segregation continues to characterize the American workplace, despite the changes that have occurred in some occupations. Millions of women continue to work in a small number of almost totally female clerical and service occupations, and men continue to make up the majority of workers in the majority of occupations.

Explaining sex segregation. Several explanations have been proposed to account for the persistence of sex segregation in the workplace; they emphasize different factors and differ strongly in the interventions they imply. Not surprisingly, the evidence neither provides full confirmation nor warrants full rejection of any single explanation. However, reviewed scientific evidence fails to support the argument that women's occupational outcomes result primarily from free choices that they make in an open market. It suggests rather that women face discrimination and institutional barriers in their education, training, and employment. Often the opportunities that women encounter in the labor market and in premarket training and education constrain their choices to a narrow set of alternatives.

The weight of scientific evidence indicates that discrimination has played a significant role in maintaining a sex-segregated work force. That women believe they face discrimination is evidenced by the thousands of sex discrimination complaints filed under Title VII of the 1964 Civil Rights Act (which prohibits sex discrimination in many employment practices). A number of statistical studies of large employers show, that equally qualified men and women are often assigned different jobs, with long-term effects on their subsequent careers. Case studies of some employers against which complaints have been filed and of certain industries provide corroborative evidence of the occurrence of sex discrimination in employment practices.

Responsibility for the daily care of family members, which women bear more than men, also undoubtedly affects labor market outcomes in many ways, but its link specifically to sex-segregated occupations is less clear. One hypothesis, based on human capital theory, is that women choose female-dominated occupations because those occupations are more compatible with child-rearing (by penalizing work interruptions less than male-dominated occupations); this hypothesis has found equivocal empirical support. Further research is warranted on connections between employment opportunities and family responsibilities for both sexes.

Reducing sex segregation. Laws and regulations of the 1960's and 1970's prohibit sex discrimination in employment and apprenticeship programs and mandate sex equity in federally funded job training programs and vocational and general education. Women have made substantial progress in entering some predominantly male occupations and training and educational programs.

Definitively establishing that women's gains were caused directly by interventions is quite difficult, however. On one hand, the very existence of anti-discrimination laws or regulations may contribute to change. According to one theory underlying law enforcement, most change occurs through voluntary compliance by establishments against which no action has been taken, either out of the desire to avoid sanctions or because laws help to reshape employers' opinions about acceptable behavior. At the same time, laws encourage women to believe that they will not face discrimination and hence to train for and pursue sex-atypical occupations. On the other hand, important changes—including women's heightened consciousness of their rights and possibilities, prompted by the feminist movement—occurred during the period in which most interventions were implemented and were an important force for their enactment. Obviously, disentangling such cultural changes is difficult. Some of the studies that attempt to demonstrate the impact of specific laws or regulations are imperfect. Taken together, however, the case studies and statistical research present a compelling case for the long-term effectiveness of legislative remedies.

The 173-page report, ***Women's Work, Men's Work: Sex Segregation on the Job***, is available ($15.50) from National Academy Press, 2101 Constitution Ave., N.W., Washington, DC 20418. □

Employment and unemployment: developments in 1985

Last year, the economy completed its third year of strong postrecession growth; however, the expansion has not been sufficient to return factory employment to its prerecession level or to drop most jobless rates to the lows of the late 1970's

SUSAN E. SHANK AND PATRICIA M. GETZ

Employment continued to increase in 1985, as the economy completed its third year of recovery from the 1981–82 recession. However, job growth slowed from the rapid pace recorded in the previous 2 years—a moderation that is typical in the third year after a business cycle trough.[1] Construction, as well as most industries in the service-producing sector, showed robust job gains throughout the year. In contrast, manufacturing employment, which had rebounded during 1983 and most of 1984, decreased in 1985—especially in the durable goods industries.

The civilian unemployment rate edged down in the second half of the year to 7.0 percent in the fourth quarter. The jobless rate had declined sharply in the first year and a half of recovery, then leveled off at about 7.3 percent from mid-1984 to mid-1985. By the fourth quarter of 1985, jobless rates for most worker groups had fallen to or below those of the July 1981 prerecession peak but remained above those in 1979—the last year that the unemployment rate had averaged less than 6 percent. All of the decline in unemployment during 1985 took place among adult workers.

This article describes labor market developments in 1985 for major age-sex, race-ethnic, industrial, and occupational groups. It also examines the performance of key employment and unemployment indicators in cyclical terms and evaluates selected developments from a secular perspective. Data discussed in this article come from two sources: household interviews and reports from employers.[2] Unless otherwise noted, over-the-year changes are based on fourth quarter-to-fourth quarter movements, and all data are seasonally adjusted.

Total employment

Civilian employment rose by 2.0 million in 1985 to 108 million at yearend. The increase took place entirely among adults—about 1.4 million women and 700,000 men. (See table 1.) The number of persons employed in agriculture decreased to approximately 3.1 million in the second half of 1985, after holding in the 3.3 to 3.4 million range over the previous decade. High levels of production worldwide contributed to sharply lower prices for U.S. farm products in 1985.[3] The unexpected deflation put many farmers in a severe credit squeeze and led to a large number of foreclosures on farm properties. Employment fell by similar amounts (about 100,000 persons) for both hired farmworkers and self-employed farmers.

Over the entire 3-year expansion (fourth-quarter 1982 to fourth-quarter 1985), civilian employment rose by almost 9 million, or 8.9 percent. The increase for adult men (about 8 percent) was the largest recorded in any 3-year recovery period since World War II; this reflected both the severity of the 1979–82 employment drop and the strength of the subsequent rebound. Employment rose even more rapidly for women (11 percent) during the 3 years of expansion. However, in contrast to the pattern for men, employment among women had continued to rise throughout the early 1980's,

---

Susan E. Shank and Patricia M. Getz are economists in the Office of Employment and Unemployment Statistics, Bureau of Labor Statistics.

despite the occurrence of back-to-back recessions in 1980 and 1981–82.

Employment-population ratios. The proportions of the civilian noninstitutional population that are employed have moved differently for men, women, and teenagers in the first half of the 1980's. As the tabulation below shows, the long-term decline in the ratio for men accelerated during the recessions of the early 1980's. The ratio only partially rebounded in 1983 and 1984, and then showed little change in 1985.

	Men	*Women*	*Teenagers*
1979 annual average	76.5	47.7	48.5

1984	73.4	50.4	44.2
1985	73.4	51.5	44.0

In contrast, the employment-population ratio for women continued the steady increase that has been evident since the mid-1950's. The increases slowed somewhat during recessions—as was the case in the early 1980's—and then resumed a strong uptrend in recoveries. The ratio for teenagers followed a pattern similar to that for men in the 1980's, but has not shown a consistent long-term trend.

Employment-population ratios for whites, blacks, and persons of Hispanic origin all declined during the recessions of the early 1980's and then rebounded in the 1983–85 period. However, as the following tabulation shows, only the ratio for whites stood above its 1979 level by late 1985.

	White	*Black*	*Hispanic*
1979 annual average	60.6	53.8	58.3
Fourth-quarter:			
1982	58.3	48.9	53.9
1983	59.8	50.1	56.2
1984	60.7	53.3	58.6
1985	61.3	53.5	57.7

The ratio for whites reached an all-time high in the fourth quarter of 1985, while that for blacks was slightly below the 1979 high. The stonger performance of the ratio for white women in the 1980's was a major factor in the overall difference; it also reversed the long-term pattern of higher ratios for black than for white women. In 1979, the ratio for black women (49 percent) exceeded that for their white counterparts (47 percent), but by the 1981–82 recession trough, the black ratio had declined to 47 percent, while that for whites had edged up to 48 percent. Both ratios increased to about 51 percent by late 1985. In contrast, the wide gap between the employment-population ratios of black and white teenagers narrowed very little in the 1980's. Only 1 out of 4 blacks aged 16 to 19 was employed in 1985, compared to about 1 out of 2 white teenagers.

The employment-population ratio for persons of Hispanic origin has remained between those of whites and blacks over the last decade. As the above tabulation shows, the Hispanic ratio, like that for blacks, fell sharply during the recession years of the early 1980's. The greater drop and subsequent rebound for minorities reflects, among other things, their heavier concentration in cyclically sensitive manual occupations.

Occupational changes. Employment growth between 1984 and 1985 was greatest for office workers, particularly highly skilled executives, administrators, and managers. The service occupations and technical, sales, and administrative support positions grew at a slightly faster pace than total employment. However, as the tabulation below shows, there was an over-the-year decrease for operators, fabricators, and laborers, as well as a sharp drop in farming, forestry, and fishing occupations.

	Percent change	
	Fourth quarter 1983–84	*Fourth quarter 1984–85*
Total	3.3	2.0
Managerial and professional	5.1	4.3
Technical, sales, and administrative	3.2	2.7
Service occupations	.9	2.6
Precision production, craft, and repair	3.5	1.4
Operators, fabricators, and laborers	3.1	−1.0
Farming, forestry, and fishing	.8	−7.9

While slower employment growth was evident in most major occupational groups from 1984 to 1985, the change was especially marked for nonfarm manual workers at all skill levels. In 1984, when construction and manufacturing rebounded strongly, job gains for skilled craft workers and for medium and low-skilled manual workers equaled the rise in total employment; in 1985, however, the increase slowed sharply for the former group and turned to a decrease for the latter. In fact, employment fell by about 3 percent over the year for machine operators, assemblers, and inspectors, most of whom are employed in manufacturing. Only managerial and professional occupations registered above-average employment increases in both 1984 and 1985.

Nonfarm payroll employment

Total nonagricultural payroll employment, as measured by the Bureau of Labor Statistics business survey, also continued to post substantial gains throughout 1985. This marked the third straight year of strong growth, which has resulted in an increase of 10 million jobs during the current recovery.[4] At 98.8 million in the fourth quarter of 1985, nonfarm employment had increased by about 3 million over the year. (See table 2.)

However, even a quick look beyond the total figure reveals marked differences among industries. All of the major divisions which make up the service-producing sector posted employment increases, with the largest gains coming in retail trade and services. Among the goods-producing industries, only construction produced a gain in employment. Significant and pervasive declines in employment characterized both mining and manufacturing. (See chart 1.) The widespread declines in manufacturing, which were concentrated in the first three quarters of 1985, reversed the strong growth trend of the previous 2 years.

Chart 2 illustrates the relative strength of the service-producing versus the goods-producing sector over the long term. Employment in the service-producing sector has been on an almost continuous upward climb for the past 40 years. Even during recessionary periods, growth slowed only temporarily, and there were no significant or prolonged declines in service-related employment during the postwar years. In marked contrast, the goods-producing sector showed only moderate overall employment growth throughout the postwar period, and each of the industries within the sector was substantially affected by recessions. Over the entire 1945–85 period, the service-producing sector gained approximately 51 million jobs, compared to 7½ million jobs in the goods-producing sector. As a result, service-producing employment grew from 57 to 75 percent of total payroll employment.

Viewed from a cyclical perspective, employment gains during the past 3 years were among the strongest in any comparable postwar period. The current expansion has already lasted longer than 3 of the 7 previous recoveries, and the growth in total nonfarm employment has outpaced that in 2 of the other 4 recoveries. (See table 3.) This has been the strongest recovery in the postwar period for construction and for most industries in the service-producing sector. For manufacturing, however, the recovery has been relatively modest, much of its earlier strength having dissipated in 1985.

Service-producing industries. In 1985, service-producing industries continued to add jobs at about the same rapid pace as during the first 2 years of the recovery, with employment in the sector increasing by 2.8 million.

The *services* division showed the largest increase, gaining well over a million jobs in 1985, with business services leading the way. Within business services, the "temporary help supply services" industry has been the strongest gainer, although there has been some moderation from the phenomenal growth rates evidenced earlier in the recovery. Health services employment continued its strong secular growth trend in 1985, and large increases were also registered in personal services and in amusement and recreation.

Retail trade also showed marked growth in 1985, as retail sales remained strong. Eating and drinking places and food stores continued their long-term uptrends, with sizable gains in each quarter. Auto dealers and service stations, which have had a strong cyclical recovery, also grew throughout 1985. Although small in terms of employment level, "radio, television, and music stores" posted the largest percentage increase—about 15 percent. This is linked to the rapidly increasing demand for video cassette recorders and the services of video clubs.

Wholesale trade employment continued to grow during 1985, particularly among wholesalers of machinery, equipment, and supplies. Employment in this industry grew despite declines in machinery and electrical equipment manufacturing jobs. Some of this strength can be attributed to the industry's strong ties to the construction industry and to large volumes of imports.

Finance, insurance, and real estate continued the healthy growth pace shown throughout the recovery. While the increases were not as spectacular as in retail trade and services, they have been very steady—between 40,000 and 80,000 jobs each quarter. One of the fastest-growing industries within this division has been "credit agencies other than banks," that is, savings and loan institutions, credit unions, and the like. This growth is tied to recent banking deregulation which has lowered barriers to entry and encouraged growth and competition in the savings and lending industry.

Transportation and public utilities employment increased

[1] Data are preliminary.

in 1985, though at a considerably slower pace than in the year before. Within transportation, railroads continued their long-term secular decline, while airlines and trucking continued to post gains. Employment in communications and other public utilities was about unchanged over the year, as declines in communications were offset by slight growth in the other public utilities. Increased competition in the telephone industry drove companies to streamline operations, in part by reducing labor costs through job cuts.

Government employment also rose in 1985, as Federal, State, and local governments each showed increases. Some of the growth in local government may be related to increases in employment in public education resulting from moves to improve the quality of education, and legislation mandating education of handicapped children.

Goods-producing industries. Employment trends for 1985 were mixed in the goods-producing sector; construction continued to advance sharply but mining and manufacturing lost jobs.

Construction employment rose by about 300,000 or 7 percent during the year, matching the growth rate in each of the 2 previous years. The greatest strength was among special trade contractors, which have increased their share of total construction employment from approximately 50 to 57 percent over the past 5 years. This category spans the entire spectrum of construction trades, from painting and papering to plumbing, electrical work, stone masonry, and roofing. Special trade contractors may be employed in new construction, renovation, or maintenance and in both residential and nonresidential construction.

Residential construction employment rose moderately, helped by relatively low mortgage interest rates in 1985. Demographic trends continued to be favorable for the industry, as the last of the baby-boom generation entered the prime age group for first-time home buying. Nonresidential construction remained strong in 1985. Despite increasing office vacancy rates, incentives such as tax shelters and the perceived security of real estate investment continued to make nonresidential construction investment attractive.

Mining is the only major division in which employment at the end of 1985 was below the 1982 recession trough level. The last strong period for mining employment was 1981 through the first quarter of 1982, when increases in oil and gas extraction associated with energy shortages fueled job growth. Since then, a worldwide oil glut and resultant price declines have had dampening effects on employment.

The year brought a reversal in employment trends in *manufacturing*. What had been a relatively strong cyclical recovery collapsed in the face of increasing import competition and a slump in the computer-related industries. In the fourth quarter, factory jobs stood at 19.4 million, 190,000 below the year-earlier level. Employment had increased by 1.4 million in the first 2 years of the recovery, but the 1985 weakness was pervasive, particularly during the first three quarters. By the fourth quarter, most of the declines had flattened out and total manufacturing employment showed a small increase.

A sharp turnaround in the nonelectrical machinery and electrical and electronic equipment industries contributed the most to manufacturing's over-the-year decline. These two industries showed considerable strength during the first 2 years of the recovery, gaining 185,000 and 300,000 jobs, respectively. During 1985, however, nonelectrical machinery lost 90,000 jobs and electrical and electronic equipment, 70,000. The biggest reductions were registered in computer-related industries, particularly electronic computing equipment and electronic components including semiconductors. The computer industry has recently begun to face serious import competition, particularly in the semiconductor market. In addition, earlier overprojections of product demand, particularly in the personal computer market, were reflected in production and employment cutbacks. Two other industries, fabricated metals and miscellaneous manufacturing, also had gained jobs earlier in the recovery but suffered declines in 1985.

Six other industries had job losses in 1985—primary metals, textiles, apparel, chemicals, petroleum, and leather. With the exception of apparel, these industries had fewer jobs at the end of 1985 than at the trough of the 1981–82 recession. Their continuing weakness is largely a reflection of long-term structural adjustment problems, aggravated in recent years by increased import competition. These six industries had a combined loss of 140,000 jobs over the year.

Three manufacturing industries showed job gains over the year—transportation equipment (70,000), printing and publishing (40,000), and food processing (20,000). The growth in transportation equipment was due mainly to increases in aircraft, guided missiles, and spacecraft manufacturing. Automobile employment, which advanced very strongly in 1983 and 1984, held about steady during 1985. Job levels in the remaining manufacturing industries were also little changed over the year.

Other economic indicators reflect the 1985 slump in manufacturing. Following growth during the first 1½ years of the recovery, the index of industrial production has essentially been at a standstill since mid-1984. Capacity utilization also peaked in mid-1984 after steady increases during the first 2 years of recovery, and has since declined.

Hours of work

The workweek of production or nonsupervisory workers on private nonagricultural payrolls remained in the narrow range of 35.0–35.2 hours throughout 1985. Following a modest decline during the recession, hours had peaked at 35.4 in early 1984, but declined slightly later that year before stabilizing in 1985. Average weekly hours have shown a long-term secular downtrend over the entire postwar period, declining nearly 5 hours between 1945 and

1985. This has largely been due to increasing percentages of employment concentrated in retail trade and services, industries which have large—and growing—numbers of part-time employees.

Average weekly hours in manufacturing declined slightly in the first half of 1985. That trend was reversed in the second half, and the factory workweek rose to a very high 40.8 hours by yearend. Factory overtime followed the same general pattern and reached 3.5 hours in the fourth quarter.

In 1985, the index of aggregate weekly hours, a more comprehensive measure which takes into account both the number of production workers and their average hours, rose for the third straight year. Spurred by the strong employment growth, it stood at 117.7 (1977 = 100) in the last quarter, its highest level ever recorded. The aggregate hours index for manufacturing fell slightly between the fourth quarters of 1984 and 1985, reflecting the decline in employment.

Unemployment

The number of unemployed persons declined in the second half of 1985 to about 8 million in December. Similarly, the jobless rate, which had remained little changed from late 1984 through the first half of 1985, dipped to 7.0 percent in the fourth quarter, down sharply from the recession high of 10.6 percent in late 1982. During the past 3 years of economic expansion, jobless rates for all civilians and for most major labor force groups fell back to or below prerecession peak (July 1981) levels. Despite these declines, jobless rates for virtually all worker groups at year's end were still above those prevailing just before the onset of the 1980 recession. As the tabulation below shows, the unemployment rate increase over the period was sharpest for men—especially those in the 25–54 age group.

	Fourth-quarter		
	1979	*1982*	*1985*
Total, 16 years and over	5.9	10.6	7.0
Men:			
16–24 years	11.6	20.3	14.0
25–54 years	3.6	9.1	5.4
55 years and over	2.8	5.8	4.0
Women:			
16–24 years	12.5	17.0	13.1
25–54 years	5.1	8.5	5.8
55 years and over	3.1	5.0	3.7

The back-to-back recessions in 1980 and 1981–82 hit the goods-producing industries extremely hard. In effect, the sector experienced one deep and prolonged downturn, as employment fell by about 3½ million between the fourth quarters of 1979 and 1982. Despite 3 full years of expansion, goods-related employment had recovered only about 80 percent of the jobs lost by the end of 1985. Weak em-

Chart 1. Employment changes by major industry division, fourth-quarter 1984–1985

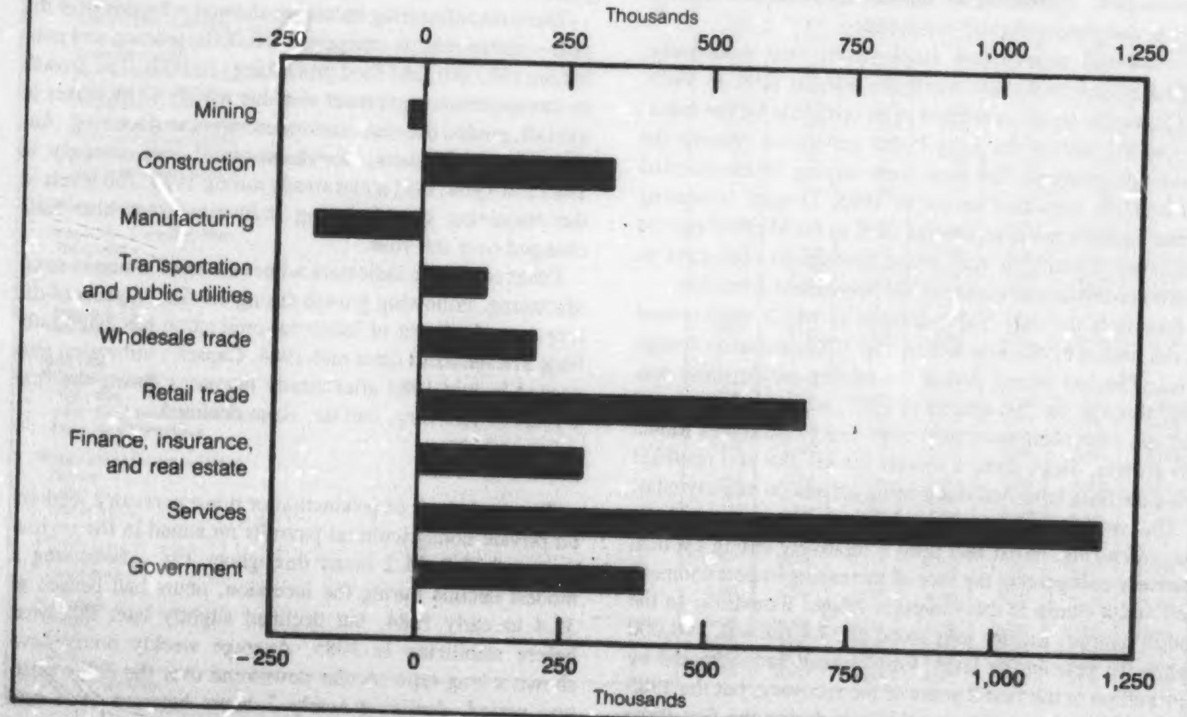

Chart 2. Employment in the service-producing and goods-producing sectors, seasonally adjusted, 1945–85

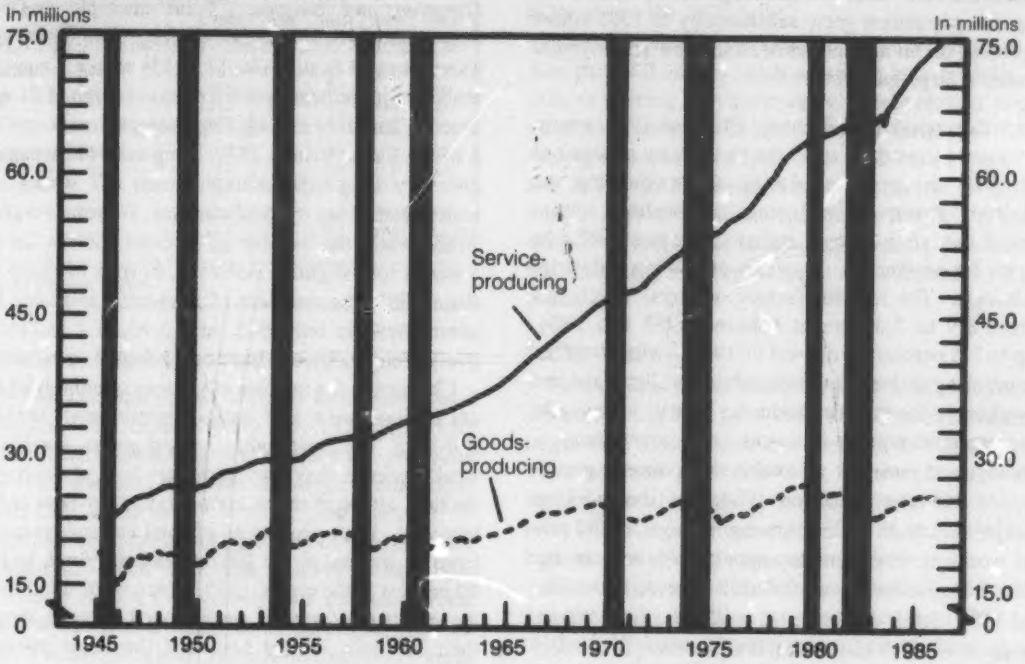


NOTE: Shaded areas indicate recessions as designated by the National Bureau of Economic Research.

ployment demand in this sector thus far in the 1980's has had its most adverse effect on men of prime working age. As the above tabulation shows, their jobless rate jumped from 3.6 percent in 1979 to 9.1 percent in 1982 before it began to recover. However, with an incomplete recovery in goods-producing employment, their rate was about 1½ times higher in 1985 than in 1979.

At the same time that employment weakened in goods-producing industries, the supply of 25- to 44-year-old workers (both men and women) expanded rapidly. As the baby-boom generation moved into adulthood in the 1980's, the work force aged 25 to 44 jumped by 12 million. In contrast, the labor force of younger workers declined and that of persons aged 45 and over was little changed between 1979 and 1985. The decrease (approximately 2 million over the period) in the number of 16- to 24-year-olds in the labor force helped to moderate unemployment problems for these younger workers.

Women of prime working age were much less affected by the cyclical swings of the 1980's than were men, because women's employment is concentrated in the steadily expanding service-producing sector. The low proportion of females employed in the goods-producing sector (20 percent versus 43 percent for men) is a major reason that jobless rates for 25- to 54-year-old women increased much less than those of their male counterparts in the early 1980's. By 1985, the jobless rate for these women had decreased to a level only moderately above the 1979 level.

Whites, blacks, and Hispanics. The longstanding disparity between white and black labor market success did not change appreciably during the recessions of the early 1980's or the subsequent strong recovery. The black jobless rate was about 15 percent at the end of 1985; the rate for whites was 6 percent. Although both rates in 1985 were substantially below their 1982 highs, neither was back to its 1979 level—about 12 percent for black workers and 5 percent for whites.

Adult men of both races accounted for most of the unemployment rate increases in the early 1980's. Their 1985 rates were still more than one-third higher than in 1979. In contrast, jobless rates for black and white women in 1985 were less than one-fourth above those of 1979. The rate for black teenagers, which had been as high as 50 percent during much of 1982 and 1983, declined to approximately 40 percent in 1985—marginally above that in 1979. For white teenagers, the 1985 rate (16 percent) was also slightly above the 1979 level.

The labor market experience for persons of Hispanic origin essentially followed the business cycle swings during the 1980's. Their unemployment rate rose from about 9 percent in 1979 to more than 15 percent in 1982 and then decreased to the 10.5- to 11-percent range in 1984 and 1985. The Hispanic population grew substantially in 1985 (more than 3 percent on an annual basis), and their employment also showed a large gain.

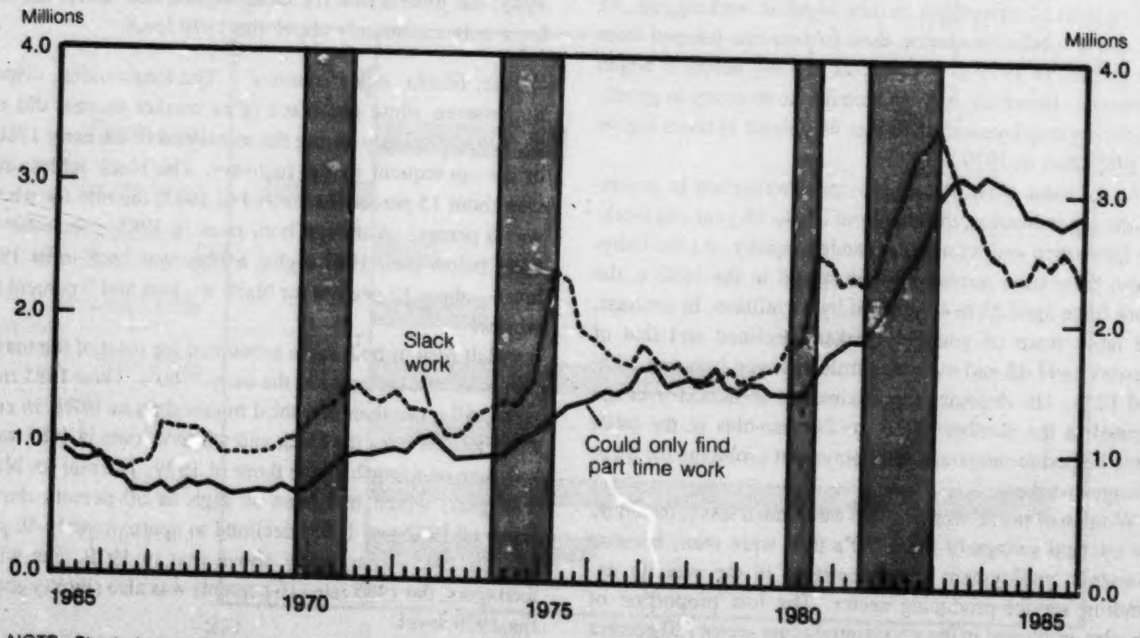
Industry and occupation. Between 1983 and 1984, unemployment rates for workers in all major industry groups had declined, with the goods-producing sector showing the sharpest drop.[5] However, while moderate declines continued in most service-producing industries during 1985, the jobless rate for workers in the goods-producing industries was unchanged. The rate for factory workers, which had fallen from 8.9 to 7.3 percent between 1983 and 1984, edged up to 7.5 percent by the end of 1985—with all of the increase occuring in durable goods industries. For wage and salary workers in the service-producing sector, jobless rate declines were most notable in services and government.

Unemployment rates for all major occupational groups had dropped between 1983 and 1984, but showed little further improvement in 1985.[6] Among managerial and professional workers, where employment growth was strong, the jobless rate declined from 2.4 to 2.2 percent between 1984 and 1985. Small declines also took place for administrative support workers and skilled craft workers in the construction trades. However, the unemployment rate was virtually unchanged for machine operators, assemblers, and inspectors, most of whom work in manufacturing.

Duration and reasons. Total unemployment declined only slightly in 1985, but the average duration of unemployment dropped from about 17 to 15½ weeks. Despite considerable improvement over the recession high of 21 weeks, the average length of an ongoing unemployment spell was still 5 weeks longer than in 1979. Long-term (15 weeks or more) and very long-term unemployment (27 weeks or more), which tend to lag cyclical changes, continued to fall during 1985, while the number of persons jobless for less than 5 weeks rose slightly. However, in spite of sharp decreases since 1983, the numbers of long-term and very long-term unemployed in late 1985, at 2.2 and 1.2 million, respectively, remained very high by historical standards.

Changes in the number of persons unemployed for different reasons were also comparatively small between 1984 and 1985. The most highly cyclical group—persons seeking work because they had lost their last jobs—continued to decline, although much more moderately than earlier in the recovery. Their proportion of total unemployment dropped from 61 percent at the 1982 recession trough to just below 50 percent at the end of 1985. There were small increases in the number of persons unemployed because they had left their last jobs or had reentered the labor market after a period of absence.

Chart 3. Number of persons working part time involuntarily by major reason, seasonally adjusted quarterly averages, 1965–85



NOTE: Shaded areas indicate recessions as designated by the National Bureau of Economic Research.

Table 3. Percent change in nonagricultural payroll employment from trough to 37 months after trough, five postwar recessions

Industry	1949 trough	1954 trough	1961 trough	1975 trough	1982 trough
Total nonagricultural	18.1	8.4	8.1	12.6	11.7
Mining	48.8	5.7	-6.7	17.9	-7.4
Construction	21.3	13.4	9.0	19.8	24.0
Manufacturing	23.3	5.9	6.6	11.8	7.4

Finance, insurance, and real estate	11.9	11.2	8.6	12.8	13.2
Services	8.8	13.1	13.7	17.1	17.4
Government	14.4	13.2	12.0	7.1	4.4

NOTE: Data are seasonally adjusted.

Short workweeks and discouragement

About 5½ million persons worked part time but wanted full-time work in 1985, down slightly from 1984. However, the number of these economic (or involuntary) part-time workers in 1985 was still 1 million above the prerecession low and 2 million above the 1979 level. (See chart 3.)

The two major components of part-time employment for economic reasons—slack work and inability to find full-time work—have behaved differently over the last several years. Slack work, which refers to an employer-initiated curtailment of hours, is highly cyclical and generally leads changes in overall economic activity because employers tend to reduce hours before laying off employees. Similarly, as the economy recovers, employers tend to restore hours before rehiring laid-off workers.[7] As the chart shows, the number on short workweeks because of slack work began to rise before the start of the last three recessions. It also led the recovery from the 1981–82 recession, falling from 3.7 million in September 1982 to 2.3 million by mid-1984. However, since the second quarter of 1984, it has fluctuated between 2.3 and 2.6 million.

Economic part-time employment stemming from an inability to find full-time work is less cyclical than slack work. In addition to the general state of the economy, this "failure to find work" series also reflects the experience, skills, and training of jobseekers and the availability of work schedules desired by workers. The number of persons who could only find part-time employment rose from early 1980 through mid-1983 and declined only slightly over the next 2½ years. At 2.9 million in 1985, the failure-to-find component of involuntary part-time employment was double the 1979 level and four times as high as in the late 1960's.

Despite 3 years of strong economic expansion, the number of discouraged workers—persons who report that they want to work but are not looking for a job because they believe they could not find one—has remained about unchanged since mid-1984. The number of discouraged workers rose from about 800,000 in 1979 to 1.8 million at the recession trough in fourth-quarter 1982. However, after dropping to 1.2 million by the third quarter of 1984, it has shown no further sustained improvement. As was true for economic part-timers, the number of discouraged workers in 1985 exceeded the 1981 prerecession peak and was substantially above the 1979 level.

Most discouraged workers cite job market factors—rather than personal factors, such as age or lack of skills, education, or training—as their reason for not seeking work. The number of persons citing job market factors, which tracks closely with business cycle swings, dropped from 1.4 million in late 1982 and early 1983 to just below 900,000 in the third quarter of 1984, and declined to 800,000 by the fourth quarter of 1985. The smaller group citing personal factors has fluctuated between 325,000 and 425,000 for the past 3 years.

Labor force

The civilian labor force rose by about 2 million, or 1.7 percent, in both 1984 and 1985. These increases, while larger than those which had occurred during the recession years between 1980 and 1983, were well below the 2.7-percent annual average gain during the 1970's. The slower pace of labor force growth thus far in the 1980's reflects both demographic changes and cyclical effects.

The civilian noninstitutional population aged 16 and over had jumped by 3 million per year during the 1970's, as most of the baby-boom generation reached working age. However, during the 1980's, the population increase eased to an average of 2.2 million, a slowdown that reflects the sharp decline in birth rates beginning in the mid-1960's. This falloff in the potential labor supply in the early 1980's, of course, coincided with a period of very weak employment demand. And as indicated earlier, the impact of 3 consecutive bad years was greatest in the cyclically sensitive goods-producing industries, in which men are more likely to be employed.

During the recessions of the early 1980's, male labor force participation rates decreased, after holding steady during the late 1970's. Table 4 shows that annual average participation rates for men and women moved differently in the 1980's, as had been the case throughout the postwar period. The long-term decline in labor force participation

Table 4. Annual average labor force participation rates by sex, selected years, 1950–85

Year	Men	Women
1950	86.4	33.9
1960	83.3	37.7
1970	79.7	43.3
1976	77.5	47.3
1977	77.7	48.4
1978	77.9	50.0
1979	77.8	50.9
1980	77.4	51.5
1981	77.0	52.1
1982	76.6	52.6
1983	76.4	52.9
1984	76.4	53.6
1985	76.3	54.5

for men has been concentrated in the older age groups, reflecting a movement toward early retirement. However, this trend was interrupted in the late 1970's, then resumed during the 1980–82 downturn, and there was no rebound at all during the 1983–85 expansion. The participation rate for women continued its secular uptrend into the 1980's, although the rate of growth moderated somewhat during the recession years. As the economic recovery continued into its second and third years, female participation accelerated, reaching 54.5 percent by 1985.

THE LABOR MARKET EXPERIENCE in the 1980's can be viewed in terms of two sharply distinct periods. The first 3 years of the decade were characterized by severe and protracted labor market problems—especially in the goods-producing industries and for adult men. The 1983–85 recovery and expansion has been strong and widespread: Employment recorded very large gains over these 3 years, and unemployment fell more than in any 3-year recovery period since the mid-1950's. However, despite sustained improvements in overall labor market measures, certain areas, such as manufacturing, remain weak. Factory employment in late 1985 was about 1 million below its 1981 prerecession peak and 2 million below its 1979 high. Moreover, while jobless rates for most worker groups fell substantially over the 1983–85 period, they had not yet returned to the lows that prevailed in the late 1970's. ☐

FOOTNOTES

[1] Business cycle peaks and troughs are designated by the National Bureau of Economic Research. The three most recent recessions extended from the following peak-to-trough dates: November 1973–March 1975, January 1980–July 1980, and July 1981–November 1982.

[2] The Current Population Survey gathers data monthly from a sample of about 60,000 households and provides information on the labor force, employment, and unemployment by demographic and economic characteristics. The Current Employment Statistics program is a monthly survey of approximately 280,000 nonagricultural establishments and provides information on the number of persons on business payrolls, as well as on average hours and earnings.

[3] The Producer Price Index for crude foodstuffs and feedstuffs dropped an average of 2 percent per month in the first 9 months of 1985.

[4] The long-term movements of employment from the Current Population Survey and the Current Employment Statistics survey are very similar. Differences in short-run changes, especially over the course of a business cycle, are not unusual. The Current Employment Statistics survey has shown more employment growth during the current recovery period, particularly between 1984 and 1985. Although the precise reasons for this divergence are unclear, there are several factors which can contribute to different survey results, including differences in definitions and coverage.

[5] Unemployed persons are classified according to the industry and occupation of their last full-time job lasting 2 weeks or more.

[6] Comparisons are based on unadjusted data averaged for the fourth quarters. Beginning in January 1983, occupational data from the Current Population Survey were coded and published according to the 1980 Census system, which evolved from the Standard Occupational Classification system. Seasonal adjustment of data based on the new classification system will not be possible until at least 5 years of data are available. For further information on the change in occupational classification, see "Revisions in the Current Population Survey Beginning in January 1983," *Employment and Earnings*, February 1983, pp. 7–15.

[7] See Robert W. Bednarzik, "Short workweeks during economic downturns," *Monthly Labor Review*, June 1983, pp. 3–11.

Part-time workers: who are they?

A new definition of part-timers, utilizing existing data from the Current Population Survey, gives a more accurate estimate of the number of part-time workers

THOMAS J. NARDONE

Although typically pictured as working 40 hours a week, the American work force includes a substantial number of persons who put in far fewer hours. Young people working while attending school, parents juggling childrearing and career responsibilities, those in retirement wishing to remain partly active in the work force, and workers whose hours have been reduced because of economic conditions are examples of persons who either choose or have to settle for part-time employment.

Because of the variety of situations found in the workplace, labor market analysts who study part-time employment have sometimes found it a difficult concept to define. Although the official government definition of part-time work is clear, estimating the number of part-time workers is more complex. It depends on exactly what is being measured—the total number of persons who worked part-time hours during the survey reference week, the number who choose to work part-time hours, or the number who typically work part time.

Each month the Bureau of Labor Statistics publishes data on the number of hours worked by persons during the survey reference week and considerable detail about persons who work less than 35 hours a week—the official boundary between full- and part-time employment.[1] The data collected include both the reasons people work less than 35 hours as well as their usual full- or part-time status. To reflect the diversity of the workplace, BLS disaggregates the data about people at work less than 35 hours into three subgroups: (1) those voluntarily at work part time, (2) those working part time for economic reasons, and (3) those who usually work full time but worked less than 35 hours during the reference week because of holiday, illness, vacation, or similar reasons. These data are combined with information on several other groupings—persons at work more than 35 hours (full-time workers), employed persons who were not at work during the survey reference week, and unemployed persons—to yield estimates of the full- and part-time labor forces. These categories are useful for a variety of analyses. The number of persons at work part time for economic reasons, for example, is of interest as a measure of underutilization of human resources and also is an important indicator of the cyclical movements in the labor market.[2] Data about the full- and part-time labor forces are used for unemployment rate calculations and to develop several of the alternative measures of unemployment that enhance our understanding of the labor market.[3]

Despite their usefulness, none of these groupings actually provides an estimate of the number of people who usually work part time. For example, the concept of voluntary part-time employment excludes persons who want full-time work but settle for a part-time job. The "at work" concept excludes the people who have part-time jobs but were away from their jobs during the survey reference week because of vacation, illness, or other reasons. The labor force categories classify some people according to the type of job they

---

Thomas J. Nardone is an economist in the Division of Employment and Unemployment Analysis, Bureau of Labor Statistics.

want, not necessarily the type they have.

This article discusses available BLS data about part-time workers, describing what information is published, and suggests a new combination of the data—all persons who usually work part time—which would provide a more accurate estimate of part-time employment. The data are based on the Current Population Survey (CPS), a monthly sample survey of about 60,000 households nationwide, which provides information on the employment and unemployment status and related characteristics of the civilian population 16 years of age and over.

Defining full and part time

When defining the full- and part-time status of workers, the first consideration is the number of hours worked during the survey reference week. As mentioned previously, 35 hours is the boundary between full- and part-time employment. Part-time work is defined as less than 35 hours a week. Working less than 35 hours during the survey week, however, is not a sufficient condition for classifying a person as a part-time worker. The worker's usual schedule and reason for working less than 35 hours a week also must be considered.[4] In addition to workers' preference, reasons for part-time hours can be economic—slack work, material shortages, beginning or ending a job, or because only a part-time job could be found—or noneconomic—holiday, vacation, illness, or bad weather. Based on their usual schedule and their reason for working a part-time schedule, persons at work less than 35 hours a week are allocated according to the pattern shown in table 1.

Those who usually work full time but during the survey reference week worked less than 35 hours for noneconomic reasons—5.6 million in 1985—are combined with those who worked more than 35 hours during the survey week under the label "full-time schedules." In terms of "labor force" classification, persons at work on "full-time schedules" are combined with persons who are not at work during the reference week but usually work more than 35 hours, those working "part time for economic reasons," and unemployed workers seeking full-time jobs to form the "full-time labor force." (See box.)

Table 1. Persons at work 1 to 34 hours by reason for working less than 35 hours, and usual status, 1985 annual averages
[In thousands]

Reason for working less than 35 hours	Total	Usually work full time	Usually work part time
Total, 16 years and older	24,682	7,342	17,340
Economic reasons	5,590	1,739	3,851
Slack work	2,430	1,398	1,032
Material shortages or repairs to plant and equipment	62	62	—
New job started during week	190	190	—
Job terminated during week	90	90	—
Could find only part-time work	2,819	—	2,819
Other reasons	19,092	5,603	13,489

Legal or religious holiday	682	682	—
Full time for this job	1,545	—	1,545
All other reasons	2,086	1,484	582

Components of the full- and part-time labor forces

Full-time labor force:
- Employed persons on full-time schedules
- Employed persons working part time for economic reasons
- Employed persons not at work, who usually work full time
- Unemployed persons seeking full-time work

Part-time labor force:
- Employed persons working part time voluntarily
- Employed persons not at work, who usually work part time
- Unemployed persons seeking part-time work

The workers who usually work part time for noneconomic reasons—13.5 million in 1985—are classified as the "voluntary part-time employed," a group that has been the focus of several studies in recent years.[5] They clearly are part-timers. The vast majority of these workers do not want or are unavailable for jobs which call for 35 hours or more of work per week. The voluntary part-time group plus those employed persons not at work during the reference week who usually work less than 35 hours a week and unemployed workers who are seeking part-time jobs form the "part-time labor force." (See box.)

As stated above, workers who put in less than 35 hours a week because of slack work, the inability to find full-time work, or similar reasons—the 5.6 million workers on part time for economic reasons in 1985—are included in the full-time labor force. However, by treating them as a single group, the usual full-time/part-time work status of such workers is not readily identified. And, the two main components of the group—persons on slack work and persons who could only find part-time jobs—are quite dissimilar in terms of their usual work status.

Most of the workers on "part time for economic reasons" due to "slack work" usually work full time, while all who "could only find part-time work" usually work part time. Persons who worked less than 35 hours during the reference week because of slack work, but who usually work full time, are workers who have full-time jobs but are on a reduced work schedule temporarily because of low demand. This group expects to return to a full-time schedule when economic conditions improve, and thus it seems reasonable to view such persons as full-time workers. Those who worked less than 35 hours because they "could only find part-time work," however, present a somewhat different situation. Despite their desire for full-time work, these persons only have part-time jobs. Their part-time status may or may not change as economic conditions improve, because they would have to find another job in order to become full-time workers. Therefore, to arrive at a more accurate estimate of the number of persons who typically work part time, it is necessary to disaggregate those working part time for economic reasons into two groups according to their usual full- or part-time schedule.

Several characteristics of those working part time for economic reasons illustrate the differences between the usual full-time and usual part-time workers. The data suggest that those who normally work full time resemble workers on "full-time schedules," whereas persons who normally work part time are more like voluntary part-time workers. One example is the number of hours worked. The following tabulation shows the percent of workers on part-time schedules for economic reasons and those on voluntary part time by the number of hours worked, 1985:

	Part time for economic reasons		*Voluntary part time*
	Usually full time	*Usually part time*	
Total	100.0	100.0	100.0
1 to 4 hours	1.3	3.5	4.4
5 to 14 hours	10.9	17.2	22.8
15 to 29 hours	42.9	54.8	54.2
30 to 34 hours	44.9	24.5	18.6

While close to half (45 percent) of the usual full-timers worked 30 to 34 hours a week, only a quarter of the usual part-timers did. More than half of the usual part-timers worked the number of hours—15 to 29 a week—typical for the "voluntary part time."

Another characteristic by which the two groups differ is the distribution by sex. As is true for people on full-time schedules, the majority of persons working part time involuntarily who usually work full time are men. In contrast, the majority of those who usually work part time—voluntarily or involuntarily—are women.

Persons who usually work part time are also like voluntary part-timers in their industrial and occupational distribution. The services and retail trade industries account for the vast majority of workers in both groups. The following tabulation shows the distribution, by industry, of nonagricultural wage and salary workers on part time for economic reasons and those on voluntary part time, 1985:

	Part time for economic reasons		*Voluntary part time*
	Usually full time	*Usually part time*	
Total	100.0	100.0	100.0
Retail trade	19.0	40.3	37.0
Services	22.4	35.4	42.6
Other industries	58.6	24.3	20.4

Among those part time for economic reasons who usually work full time, a sizable proportion are in the manufacturing and construction industries. The occupational distributions reflect these industry differences. "Sales" and "service" occupations accounted for the largest part of both voluntary and involuntary usual part-timers. In contrast, "precision production, craft, and repair" and "operator, fabricator, and laborer" occupations accounted for about half the economic part-timers who usually are full time.

The inclusion of all persons usually working part time for voluntary and economic reasons in the count of persons employed part time also helps reconcile recent trends in part-time employment and industry growth, and highlights the importance of part-time workers in the labor market. Between 1979 and 1985, employment in retail trade and services increased by 7 million. Because firms in those industries make extensive use of part-time workers, a significant rise in part-time employment also should have occurred during that period. Voluntary part-time employment—the traditional measure of part-time employment—increased by only 596,000. If all persons who usually work part time are tallied, however, the increase for the period would have been 2.4 million. This is more in line with the growth in retail trade and service employment. Further, the part-time employed measure shows that during the 1970's and early 1980's, part-time employment grew more rapidly than full-time employment. (See chart 1.) The rapid growth of part-time employment has led to some restructuring of the work force. Between 1968 and 1980, the proportion of employed persons who work part time edged up from 14 to 17 percent. The proportion reached 18 percent in 1982 as the recession forced more workers to settle for part-time employment. However, as the economy recovered during the 1983-85 period, the percentage returned to 17 percent.

Based on the findings presented above, it would seem that the most simple, straightforward answer to the question "How many part-time workers are there?" is a tally of the number of workers who usually work part time, regardless of the reason for their short hours. It would more accurately estimate the number of part-time workers according to the kinds of jobs they typically have.[6] Beginning with data for January 1986, the Bureau is revising table A-9 in its monthly periodical *Employment and Earnings*, to show employment by usual full- and part-time status in line with the concepts discussed in this article. Table 2 presents 1985 annual average data displayed by the format for the revised monthly table. Historical data are presented in table 3. Monthly and quarterly seasonally adjusted data series will be available in April 1986.

Characteristics of part-time workers

Younger (ages 16 to 24) and older (65 and over) workers account for a much higher proportion of the part- than full-time employed. (See table 4.) A part-time schedule allows young people to attend school while working. The connection between part-time work and school attendance is shown in the new BLS series on employment status by school enrollment. In October 1985, 6.3 million people between the ages of 16 and 24 were in school and employed. About four-fifths of these worked part time. By comparison, of the 13.8 million in that age group who worked but were not enrolled in school, fewer than 15 percent were part-timers.[7] Part-time schedules are attractive to older workers, who use them to ease the transition into retirement. These jobs also provide supplementary retirement income.

While age differences between part- and full-time workers occur among both sexes, differences are more pronounced among men. Nearly two-thirds of male part-timers are 16 to 24 years old or 65 years and older, compared with only one-third of their female counterparts.

Women make up the majority of the part-time employed—two-thirds of the total in 1985. (See table 4.) While full-time employment is the norm for both sexes, about 27 percent of the women are employed part time, compared with 10 percent of the men. This difference probably reflects the higher proportion of women who also handle household and childrearing responsibilities and therefore need flexibility in their work schedules.

About 6 of 10 women employed part time are married with their spouse present, about the same proportion as women who are employed full time. About 3 of 10 have never been married, a higher ratio than among women employed full time. This reflects the fact that female teenagers are more likely to be part-timers.

While most women who are employed part time are married, most men are single. Men who work part time are three times as likely as those employed full time to be single. This difference results from the high proportion of very young men working part time.

As shown in the tabulation below, a slightly higher proportion of whites than blacks were employed part time in 1985—18 versus 16 percent. This difference was greater among women than men. Women accounted for about two-thirds of those usually employed part time among each racial group. (Also see table 4.)

	Percent of employed persons usually working:	
	Full time	*Part time*
White	82.4	17.6
Men	90.2	9.8
Women	72.4	27.6
Black	84.0	16.0
Men	88.1	11.9
Women	79.9	20.1

Industry and occupational distribution

Part-time workers are more apt than their full-time counterparts to hold jobs in retail trade and services industries.

[1] Employed persons with a job but not at work are distributed according to whether they usually work full or part time.

NOTE: Detail may not add to totals because of rounding.

Together, these industries accounted for 79 percent of the part-time nonagricultural wage and salary workers. This concentration is mirrored in the occupational distribution; nearly half of all part-timers are in sales or service jobs.

The high concentration of part-time workers in retail trade and services reflects their importance in these industries. A third of the wage and salary workers in retail trade and a fifth of those in services are employed part time. The extensive use of part-time workers in these industries results from the need of such businesses to offer services to customers during evenings and other times that are not readily staffed by full-timers. In goods-producing industries where operations generally are conducted in one 8-hour shift or more, the usefulness of part-time workers is limited. As a result, these

industries have very low percentages of part-time workers. And, the occupations that are concentrated in those industries such as precision production, craft, and repair and operators, fabricators, and laborers have a very low percentage of part-time workers. As expected, another occupational group that typically has a low percentage of part-timers is executive, administrative, and managerial.[8]

AN ALTERNATIVE WAY of combining existing data to estimate the number of part-time workers has been presented in this article. Counting as "part-time employed" all persons who usually work less than 35 hours a week appears to reflect existing labor market conditions. However, there are limitations to this estimate. To the extent that some workers hold a full-time as well as a part-time job or combine two separate part-time jobs in order to work more than 35 hours a week, the suggested "part-time employed" figure underestimates the number of part-time jobs. This problem occurs because, in the CPS, multiple job-holders are counted only once. Nevertheless, the CPS data are the only source of current information about workers on part-time schedules, and defining the part-time employed as suggested in this article appears to be an accurate way to answer the often-asked question: How many part-time workers are there? □

——*FOOTNOTES*——

[1] This definition has been in effect since 1947. Over the years some labor market analysts have suggested this cutoff be revised, arguing that overall hours of work have declined over the long run, and thus the 40-hour standard workweek, upon which the definition of the full-time workweek is based, may no longer be the norm. The National Commission on Employment and Unemployment Statistics addressed the issue in their report, *Counting the Labor Force*. They found no evidence of a significant change from the 40-hour standard and thus recommended that 35 hours continue to be used as the dividing line between part- and full-time work. See *Counting the Labor Force*, National Commission on Employment and Unemployment Statistics (Washington, Government Printing Office, 1979), pp. 54–55.

[2] For a discussion of the cyclical sensitivity of this measure and its component parts, see Robert W. Bednarzik, "Short workweeks during economic downturns," *Monthly Labor Review*, June 1983, pp. 3–11.

[3] Each month in the news release, "The Employment Situation," BLS publishes a set of alternative measures of unemployment. These measures, labeled U–1 through U–7, are designed to reflect a wide range of assumptions about unemployment. Three of the alternatives involve the full-time/part-time concepts. U–4 is defined as unemployed full-time jobseekers as a percent of the full-time labor force. U–6 is defined as total full-time jobseekers plus half of the part-time jobseekers plus half of the total working part time for economic reasons as a percent of the civilian labor force less

half of the part-time labor force. U-7 is the same as U-6 with the number of discouraged workers added to the count of jobseekers and the civilian labor force.

[4] Employed persons with a job but not at work during the survey reference week are classified as full- or part-time workers according to whether they usually work 35 hours or more. This group averaged 5.8 million in 1985, and ranged from a low of 3.9 million in November to a high of 11.8 million in July.

[5] See Carol Leon and Robert W. Bednarzik, "A profile of women on part-time schedules," *Monthly Labor Review*, October 1978, pp. 3–12; and William V. Deutermann, Jr. and Scott Campbell Brown, "Voluntary part-time workers: a growing part of the labor force," *Monthly Labor Review*, June 1978, pp. 3–10. The latter article dealt only with nonagricultural employment.

[6] In terms of the existing classifications, a count of the part-time employed would include voluntary part-timers, the part-timers for economic reasons who usually work part time, and persons with a job but not at work who usually work less than 35 hours a week.

Tenements house some hard numbers

During the winter of 1914–15 the Committee on Unemployment formed by Mayor John P. Mitchell called upon the Bureau of Labor Statistics for a series of field surveys of unemployment in New York City. The committee had collected data from employers on the number employed in a week of December 1914 and for the corresponding week of December 1913. At about the same time, the Metropolitan Life Insurance Company, in cooperation with the Mayor's Committee, had surveyed its industrial policyholders in Greater New York. At the request of the committee, with personnel borrowed from the U.S. Immigration Bureau and the New York City Tenement House Inspection Service, the Bureau covered over 100 city blocks and some 3,700 individual tenement houses in January and February 1915. It found an unemployment rate of 16.2 percent, which approximated the 18-percent rate reported by Metropolitan. The results were published by the Bureau in *Unemployment in New York City, New York.*

[BLS Commissioner] Meeker then contracted with Metropolitan for studies in 16 cities in the East and Middle West and in 12 Rocky Mountain and Pacific Coast cities. In August and September 1915, at the urging of the Mayor's Committee, both the Bureau and Metropolitan conducted surveys in New York City for a second time. The results of this work were presented in 1916 in a Bureau publication, *Unemployment in the United States.*

Statistics, 1985).

Hourly paid workers: who they are and what they earn

More than half of all wage and salary workers were paid by the hour during 1984; median earnings were $5.95 per hour, but a closer look reveals many variations among groups

EARL F. MELLOR AND STEVEN E. HAUGEN

The Bureau of Labor Statistics publishes several different data series on the hourly earnings of workers, each highlighting different worker and job-related characteristics. All but one of these series are based on surveys of payroll and other records of business establishments. Data from these series contain considerable industrial detail. In contrast, the remaining earnings series is based on a nationwide sample survey of households, and provides detailed information on hourly earnings by the demographic and social characteristics of the wage earners.[1] (See the appendix on page 26.) Moreover, the earnings obtained in the Current Population Survey (CPS) of households represent *only* hourly wages paid to the employee—stripped of any effects of tips, premium pay for overtime, bonuses, and commissions. More than half of all wage and salary workers are in this category.

Earl F. Mellor and Steven E. Haugen are economists in the Division of Employment and Unemployment Analysis, Office of Employment and Unemployment Statistics, Bureau of Labor Statistics.

Who is paid by the hour

Altogether, 92 million American workers were paid wages or salaries in 1984, and 54 million of them were paid at hourly rates. The method of remuneration received by workers is closely linked to the nature of jobs held. For example, 80 percent of all part-time workers were paid by the hour, compared with 54 percent of the full-time workers. The fact that women were more likely than men to work part time is reflected in the larger proportion of women who were paid by the hour—62 percent versus 56 percent (table 1).

The same explanation applies to younger versus older workers. The proportion paid hourly rates was highest for teenagers—89 percent—and lowest for those in the central prime age groups, comprising the 35 to 49 population. Even for those aged 70 and over, the proportion was far below that for teenagers and young adults. The high proportion of young workers paid by the hour reflects their tendency to work both part time and part year, and in occupations less likely to be salaried even when they are employed all year in full-time jobs.

Handlers, equipment cleaners, helpers, and laborers	4,294	3,574	720	3,872	3,215	657	90.2	90.0	91.3
Farming, forestry, and fishing	1,776	1,540	236	1,041	879	162	58.6	57.1	68.6

[1] Data not shown where base is less than 50,000.

NOTE: Detail for the above race and Hispanic origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Among white workers, women were more likely than men to be paid hourly rates, while the reverse was true—albeit to a lesser extent—for blacks and Hispanics. The following tabulation shows, however, that the situation is quite different when numbers are reported for full- and part-time workers.

	Percent paid hourly rates			
	Full time		*Part time*	
	Men	*Women*	*Men*	*Women*
White	52.0	52.5	79.1	81.2
Black	68.3	64.3	77.5	77.3
Hispanic origin	69.4	61.6	80.3	84.7

For full-time employees, the more hours people work, the more likely they are to be in a salaried rather than in an hourly paid position. About three-fifths of the men who usually worked exactly 40 hours a week were paid hourly, compared with just over two-fifths for those working 45 to 48 hours and one-fifth for those working 60 hours or more. This pattern was similar for women working full time.

The occupational distribution of hourly paid workers sheds further light on this relationship. As shown in table 1, fewer than one-fifth of workers in executive, administrative, and managerial occupations and about one-fourth of those in professional specialty occupations were paid hourly rates. A substantial number of employees in these occupations put in long workweeks, with one-quarter of the two groups (combined) working 49 hours or more a week.[2] In contrast, about nine-tenths of workers employed as machine operators, assemblers, and inspectors, and as handlers, equipment cleaners, helpers, and laborers were paid hourly wages, but fewer than one-tenth put in 49 or more hours a week.

Table 2. Median hourly earnings of workers paid hourly rates by selected characteristics, 1984 annual averages

College, 5 years or more	9.14	9.90	8.48

[1] Data not shown where base is less than 50,000.

NOTE: Data refer to persons 16 years and over, except years of school completed, which relate to the population 25 years and over.

The data illustrate the inverse relationship between the number of hours usually worked and the likelihood of being paid at an hourly rate. It is beyond the scope of this article, however, to fully explain the nature of this relationship, because information is not collected in the CPS on several of the factors which may be involved. These include data on the overtime provisions of the Fair Labor Standards Act, the provisions of collective bargaining agreements, the extent of nonpecuniary compensation derived from a job, and productivity.

Median hourly earnings

Median hourly earnings for people who were *actually paid* hourly rates in 1984 were $5.95—$7.27 for men and $5.08 for women. (See table 2.) It is important to understand the significance of what these data represent: Hourly earnings data are commonly calculated for *all* workers (wage and salary) based on information on their weekly or annual earnings. These figures will be typically higher than would be the case for those whose pay rate is hourly. For example, the median weekly earnings of all workers putting in *exactly* 40 hours a week—a majority of all workers—was $312 in 1984; when divided by 40, this turns out to be $7.80 an hour. The median hourly wage among workers actually paid by the hour and reported as usually working 40 hours a week was $6.95. This difference is to be expected, because the weekly earnings data include components of earnings beyond straight-time wages and many higher-paying jobs are salaried.

The overall female-to-male earnings ratio for full-time workers paid hourly rates—70 percent—is 5 percentage points higher than that associated with the medians in the weekly earnings series for all full-time workers (65 percent). This finding may be explained by the more homogeneous universe for the hourly earnings data mentioned above; that is, male-dominated higher-paying occupations are more likely to be salaried.

Between 1979 and 1984, the female-to-male earnings ratio for hourly paid workers rose considerably for whites, blacks, and Hispanics, whereas the black-to-white and the Hispanic-to-white earnings ratios were virtually unchanged. (See table 3.) Regardless of race or ethnicity, the hourly earnings of men rose by about 25 percent over the period and those of women about 40 percent; the Consumer Price Index for All Urban Consumers rose 43 percent.

Among age groups, median hourly earnings ranged from $3.64 for teenagers to highs in the $7.17–$7.37 range for age groups within the 30- to 54-year bracket in 1984. Men's wages peaked at about $10 an hour for those between 40 and 54 years of age, while the peak for women—$5.81—was not only much less, but also occurred at a younger age—among those in their thirties. The female-to-male earnings ratio, at about 90 percent for teenagers, declined with age to the 45-to-49 group, and rose thereafter. The higher ratios at both ends of the age spectrum may stem from the fact that higher proportions of wage earners in these age groups are paid at or near the minimum wage.

Hourly pay is wide-ranging among occupational and industry groups. Median hourly pay ranged from $4.08 for all service jobs to $9.42 among the professional specialty jobs. In the latter group, the median for men was a little more than a dollar higher per hour than that for women, a gap much closer than the overall difference. Among the major industrial groups, median hourly wages of both men and women were highest in mining, construction, durable goods manufacturing, and the transportation and public utilities group. Wages were lowest in retail trade, private households, personal services, entertainment and recreation, social services, and agriculture.

Earnings distribution

Clearly, median earnings do not tell the whole story. The median for two different groups could be similar; yet the distribution of earnings of one group may be tightly clustered around the median, while that for another group may be dispersed. Therefore, it is useful to look at distributions as well. Table 4 shows the percent distribution of hourly wages for major demographic groups. Regardless of the median, each demographic group has some people with earnings of less than $3 an hour and others with as much as $15 or more. (It should be noted that for some population groups, the extremes of the distribution may contain only a small number of sample observations.) The following discussion focuses briefly on the likelihood of wage earners receiving $12 an hour or more, the figure that is roughly twice the overall median of $5.95, and on those earning at or below the prevailing minimum wage of $3.35, which is a little more than half the median. Each of these high-paying and low-paying categories accounts for roughly one-tenth of all hourly paid workers.

Receiving $12 or more per hour. The likelihood of earning at least $12 an hour in 1984 was over 5 times as great for men (about 17 percent) as for women (3 percent). The proportion for white men was about half again as high as that for black men; among women, both whites and blacks were about equally as likely to earn this amount (each about 3 percent). Fewer than 2 percent of the workers under age 25 were in this higher paying category. Among workers 25 and over, the proportion rose from 6 percent for those with only an elementary school education to 23 percent for those completing 4 or more years of college. At each level of schooling completed, men were more likely than women to earn $12 an hour or more. However, the disparity narrowed at successively higher educational levels, as men not completing high school were more than 10 times as likely as women to earn this amount. Among those with 4 years of high school or more, men were 5 times as likely as women to earn $12 per hour or more (26 versus 5 percent). The ratio was 2 to 1 among college graduates (31 versus 16 percent).

Table 3. Median hourly earnings of workers paid hourly rates by sex, race, and Hispanic origin, 1979–84 annual averages

Characteristic	1979	1980	1981	1982	1983	1984

White	62.1	62.6	63.7	65.3	67.8	68.9
Black	71.6	74.3	72.0	74.0	78.7	79.5
Hispanic origin	70.7	74.7	76.1	76.0	75.3	76.7
Black-to-white	92.3	90.3	94.5	93.8	91.8	90.2
Men	85.4	82.6	86.7	85.6	84.5	85.0
Women	98.4	98.0	97.9	97.0	98.0	98.0
Hispanic origin-to-white	91.4	90.1	92.5	93.1	91.1	89.5
Men	82.9	80.1	79.7	81.2	82.1	83.5
Women	94.3	95.5	95.2	94.6	91.2	92.9

About 13 percent of full-time wage earners made at least $12—19 percent of the men and 4 percent of the women—but fewer than 3 percent of part-time workers earned this amount. Among workers putting in more than 40 hours a week, the proportion was 15 percent—18 percent for men and 6 percent for women.

Among the major occupational groups, 25 percent of both professional specialty workers and those in the precision production, craft, and repair group earned $12 an hour or more in 1984. At the lower extreme, 2 percent or fewer of those in sales; service (except protective service); and farming, forestry, and fishery jobs earned this much.

Minimum and subminimum wage workers. The prevailing minimum wage, which has been $3.35 per hour since January 1981, was established by the 1977 revisions to the Fair Labor Standards Act (FLSA) of 1938. About 4.1 million workers were reported as earning exactly $3.35 an hour in 1984, and 1.8 million were reported as earning less than this amount. Together, these workers constituted about 11 percent of all hourly paid workers.

It is important to note at the outset that the presence of a sizable group of hourly paid workers receiving less than the minimum wage does not necessarily indicate widespread violations of the FLSA, as there are a number of exemptions to its minimum wage provisions. These exemptions are wide-ranging and include employees in outside sales work, low volume retail trade and service firms, and seasonal amusement establishments.[3]

For the most part, those earning $3.35 and hour or less tend to be young. About 60 percent of those with these low earnings were under age 25—one-third were teenagers.

Among teenagers alone, nearly 40 percent earned $3.35 or less. Persons 65 and over—while representing only 3 percent of the total number of minimum wage earners—also had a relatively high probability of earning at or below $3.35, as nearly 1 out of 5 hourly paid persons in this age group earned this amount. (See table 5.)

Nearly 15 percent of all women who were paid hourly rates earned the prevailing minimum wage or below, which was double the proportion for men. These percentages, however, differed greatly according to whether the employee usually worked full or part time, as shown in the following tabulation:

	Percent at or below $3.35		
	Both sexes	*Men*	*Women*
Total	11.0	7.5	14.8
Part-time workers	28.0	30.2	27.0
Full-time workers	5.2	3.5	7.6
35 to 39 hours	12.1	10.5	12.8
40 hours	4.6	3.3	6.5
41 hours or more	3.7	2.4	8.5

The number of part-time workers earning $3.35 or less, at 3.9 million, was nearly twice the number working full time. Given the fact that women made up a disproportionate share of part-time workers paid hourly rates (69 percent), those working part time accounted for almost 45 percent of all low-wage workers in 1984; men working part time accounted for about 21 percent.

An examination of minimum wage workers by race and ethnicity shows that only a slightly higher proportion of blacks than whites and Hispanics earned $3.35 or less. Nearly 14 percent of the black population were in this earnings group, compared with 11 percent of both Hispanics and whites.

Given the direct correlation of educational attainment and earnings, the likelihood that a person had hourly earnings at or below $3.35 per hour diminished with increased schooling. Among hourly paid workers aged 25 years and over with less than 4 years of high school, 10 percent were low wage earners, compared with 6 percent who finished 4 years of high school, and less than 4 percent of those with 4 years or more of college.

Of the four major regions in the United States, the largest proportion of those at or below the minimum wage lived in the South (40 percent). Overall, 13 percent of all hourly paid

Table 4. Percent distribution of hourly earnings of workers paid hourly rates by selected characteristics, 1984 annual averages

workers in the South earned the minimum or less, compared with 12 percent in the North Central region, 9 percent in the Northeast, and 8 percent in the West.

Nearly half of all minimum wage workers held service-type jobs in 1984. Service occupations with the highest concentrations of low-paying jobs included private household work, food services, and cleaning and building services. It is notable that persons employed as food service workers accounted for 31 percent of all workers at or below the minimum wage; of that number, roughly half worked at the minimum of $3.35 and half worked below this level. Another area in which there was a large proportion of persons working at or below $3.35 was in sales occupations, particularly in retail sales, in which nearly 1 out of every 4 employees earned the minimum or less. It should be remembered, however, that for many working in sales and food service occupations, tips and commissions supplement (to varying degrees) the hourly wages received.

THIS ARTICLE has focused on earnings as a pure wage paid to the employee—stripped of any effects of tips, premium pay for overtime, bonuses, and commissions. As the findings have suggested, the wealth of information available from the Current Population Survey helps provide a foundation for further studies which can shed more light on the conditions of workers paid hourly rates. □

——— FOOTNOTES ———

[1] See *BLS Measures of Compensation*, Bulletin 2239 (Bureau of Labor Statistics, 1986), for a complete description of all BLS earnings series. Among these are the Current Employment Statistics Survey, Area Wage Surveys, and Industry Wage Surveys.

[2] Data on workweeks by occupation refer to hours actually worked during each month's survey reference week rather than to the number of hours usually worked. In the case of workers with two or more jobs, the data are tabulated according to the occupation at which the employee works the most hours.

[3] See *Report of the Minimum Wage Study Commission*, Volume 1, p. 107, for a more complete list of full and partial exemptions.

APPENDIX: Hourly earnings data from the CPS

The Current Population Survey (CPS) is a monthly sample survey conducted by the U.S. Bureau of the Census for the Bureau of Labor Statistics, totaling about 59,500 households, in 50 States and the District of Columbia. Data on hourly earnings are collected from one-quarter of each month's CPS sample through questions 25B and 25C, which read:

> 25B. Is . . . paid by the hour on this job?
>
> 25C. How much does . . . earn per hour?

Although data are collected monthly, the numbers are aggregated into quarterly and annual averages to increase their statistical reliability. On a quarterly basis, the data are tabulated by sex, race, Hispanic origin, age, marital status, major occupation and industry groups, and usual full- or part-time status. Annual average data are also tabulated by region of residence, number of hours usually worked, years of school completed, and more occupational and industrial detail. While both the quarterly and annual average tabulations provide distributional data (for example, the number of workers earning between $5 and $5.99 per hour), the latter show more wage categories, as well as data for minimum wage workers.

Between 1973 and 1978, hourly earnings data were collected only once a year as part of a supplement to each May's CPS. Comparability between these and more recent data is affected by changes in questionnaire design, the coverage of the wage and salary worker universe, and the handling of survey nonresponses. As a result, whereas estimates of the proportion of all workers paid hourly rates between 1973 and 1978 ranged between 49 and 51 percent, changes introduced in 1979 caused the proportion to jump to 59 percent, where it has remained. In 1983, there were changes to the entire occupational classification system which preclude occupational comparisons with previous years. In addition, a change in the method of estimating medians introduced the same year affects the comparability of any medians under $3.00 or over $5.99 per hour.

As is the case with estimates from any sample survey, the results can vary by chance because a sample, rather than the entire population, is surveyed. A measure of this variation is called the standard error. If samples are repeatedly drawn and estimates are computed from each sample, in approximately 68 out of 100 samples the actual population value will differ from the sample estimate by less than one standard error. In approximately 90 out of 100 samples, the population value will differ from the sample estimate by less than 1.6 times the standard error. All statements of comparison appearing in this article are significant at the 90-percent level or higher. Users are cautioned against drawing conclusions from small differences among numbers for small population groups because of the relatively large sampling errors associated with estimates based on small sample sizes. In addition, results are subject to errors of response and nonreporting—errors possible even in a complete census. These can result from differences in the interpretation of questions, the inability or unwillingness of respondents to provide correct answers, the rounding of figures, errors of processing, and errors made in estimating values for missing data. For more information regarding the collection, processing, merits, and limitations of CPS data on earnings, see Earl F. Mellor, *Technical Description of the Quarterly Data on Weekly Earnings from the Current Population Survey*, Bulletin 2113 (Bureau of Labor Statistics, 1982).

Employment lessons from the electronics industry

Semiskilled and 'unskilled' workers in semiconductors, computer manufacturing, and consumer electronics industries are more likely than other workers to lose jobs because of technology, imports, and offshore production; advances in technology create jobs for skilled workers

John A. Alic and Martha Caldwell Harris

In the U.S. electronics industry, competition—domestic as well as international—has led to increases in labor productivity through changes in product design and automation and to transfers of manufacturing operations to low-wage developing countries. For example, in the consumer electronics industry, annual output of color television sets per production worker in the United States increased from 150 in 1971 to 560 in 1981. Total output nearly doubled, from 5.4 million sets to 10.5 million. At the same time, domestic employment in color television manufacture dropped by half—a result of greater foreign value-added, redesigned televisions with fewer parts and less need for assembly labor, and automation. The example is not atypical, the implications are clear: new technology can cut into job opportunities even though output rises substantially.

In two other sectors of the electronics industry—microelectronics (which includes semiconductors) and computers—employment has grown rapidly. (The 1985 layoffs will, as in earlier business slumps, prove temporary.) Microelectronics technology made redesigned color television sets possible, and far more Americans now work for semiconductor manufacturers than were ever employed in consumer electronics. Skilled and professional jobs predominate in microelectronics, accounting for nearly 60 percent of employment, compared with about 30 percent in consumer electronics. Similar patterns exist elsewhere in high technology electronics: continuing advances in both products and processes leave relatively fewer openings for unskilled and semiskilled workers. Indeed, jobs for production workers in U.S. computer firms declined slightly during 1984, although overall employment in the computer sector rose.

American consumer electronics firms have faced stiff foreign competition since the latter part of the 1960's. But only in the last few years have U.S.-based microelectronics and computer manufacturers found competitors from Japan able to match their product offerings. Given declining advantages in product technology, and Japan's proven capabilities in process technology, American manufacturing companies have been forced to change their priorities. Within any manufacturing organization, quality and productivity, hence costs and competitiveness, depend on the integration of workers and machines into an efficient and effective production system. Highly automated plants will demand new ways of using skills, resolving conflicts, and making decisions. The emphasis on shared responsibility and decision-making in Japanese organizations appears to give them a head start in integrated production systems. Japan's manufacturers are more adept at utilizing the skills and capabilities of their work force, and are further along at integrating workers and machines—an important source of competitive advantage.

In a given industry, job opportunities change with demand for the industry's products, with shifting patterns of international competition, and with increases in labor

productivity. The latter stem not only from automation and work reorganization, but from products redesigned for easier, cheaper manufacture. Rising worldwide demand for the output of a given industry will create new jobs only if demand rises more rapidly than productivity. From the perspective of a national economy, net job creation also depends on trends in imports and exports and on foreign and domestic investments. Imports may displace domestic production; overseas investment by domestic companies may do the same.

In any economy, new jobs are continually being created, old jobs eliminated. At the level of the firms, jobs are created as companies are established or expand, and jobs disappear as companies atrophy and die or move production overseas. Over time, automation, work redesign, and organizational change help fewer workers produce more. If a firm cannot sell enough of the additional output, it may have to reduce its labor force. Even if it can increase sales, improvements in efficiency necessarily cut into future job opportunities. Aggregate economic growth provides the gross context for job creation and job destruction; the organization of work within the enterprise creates the fine structure.

This article discusses factors which affect employment in two components of the U.S. electronics industry[1]—consumer electronics (SIC 3651) and microelectronics (SIC 3674), touching briefly on computer manufacturing (SIC 3573).[2]

Employment trends in electronics

Employment in U.S. manufacturing has been essentially static since the late 1960's, but declined relatively over the 1974–84 period from 26 to 21 percent of the nonagricultural work force. However, in electronics, employment expanded rapidly over the period—although not in all parts of the industry. Employment has nearly doubled in microelectronics and has increased even faster in computers, while the consumer electronics category (which includes many types of products other than television sets) has shrunk. The following tabulation shows the number of employees and the percent of production workers in consumer electronics, microelectronics, and computer and peripherals industries, 1974, 1984, and the first 6 months of 1985:

Industry	*1974*	*1984*	*1985, first half*
	Number of employees		
Consumer electronics	113,600	71,800	68,400
Microelectronics	148,300	273,000	283,300
Computers and peripherals	217,000	460,900	456,900
	Percent production workers		
	1974	*1984*	*1985, first half*
Consumer electronics	74	68	66
Microelectronics	51	43	41
Computers and peripherals	39	37	35

By mid-1985, the 808,600 workers in consumer electronics, microelectronics, and computer firms accounted for more than 4 percent of the U.S. manufacturing labor force. Although these firms make up only a portion of the electronics industry, they employ more than twice as many workers as the steel industry.[3]

Chart 1 compares trends in labor productivity and production employment over the past decade for each of the three categories discussed in this article. (Productivity is plotted as value-added per production worker hour in inflation-adjusted terms.) Value-added productivity growth in consumer electronics—where employment declined—has roughly paralleled the all-manufacturing average. In contrast, computer manufacture shows a rapid rise in employment, with productivity rising almost as fast until the mid-1970's. Many jobs have also been created in microelectronics, where productivity gains were again substantially above the all-manufacturing average. With both computers and microelectronics suffering from business slowdowns during 1985, layoffs have been common and total employment has dropped.[4] No doubt these declines will prove temporary, with employment levels rebounding once the slump has passed, as occurred twice during the 1970's for both the microelectronics and computer sectors. Over the long term, however, employment prospects in the U.S. computer industry appear far better than those in microelectronics.

Productivity trends are seldom unambiguous. Their significance can be questioned when technological change is as rapid as it has been in computers and peripherals and in microelectronics. In these sectors, product performance has advanced rapidly; today's dollar buys far more capability than it did a few years ago.[5] In color television manufacture, technical change has been much slower, with intense price competition depressing value-added productivity measures compared with other U.S. industries over the 1965–82 period; the retail price index for color television sets increased by less than 5 percent, while that for all consumer durables more than doubled. Productivity on a unit output basis for color television manufacture has, however, risen far more rapidly than on a value-added basis.

As chart 1 demonstrates, the portions of the electronics industry with the highest rates of value-added productivity growth (microelectronics and computers) also experienced the highest rates of employment growth. Rapid increases in productivity were associated with the creation of jobs, not their elimination. The reasons are straightforward: spurred by technological changes opening vast new markets, export as well as domestic, output in microelectronics and computers has for many years grown at rates in the vicinity of 15 percent annually, far higher than the rate for all manufacturing. In contrast, the domestic market for consumer electronics grew less than half as fast, exports were small, and import penetration was severe; the value-added productivity measures for consumer electronics reflect the plight of an

industry hard pressed by foreign competition and striving to make relatively standard products more cheaply.

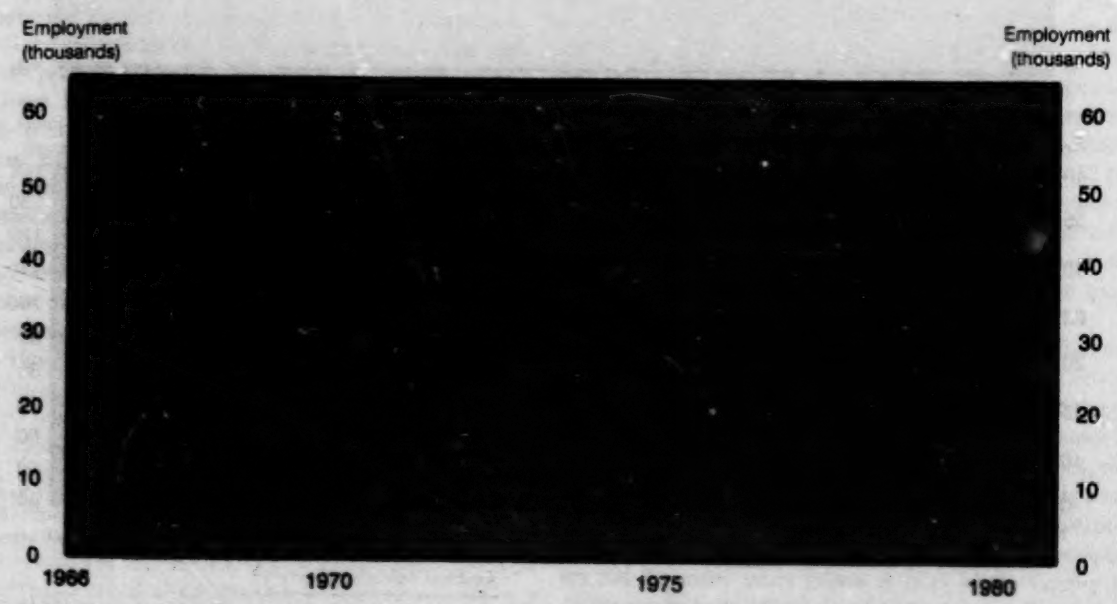
The examples of microelectronics and computers show that when technological change is rapid, rates of productivity increase may be high while employment nonetheless rises. Similar correlations sometimes follow at the aggregate level; rates of unemployment may drop nationwide while productivity climbs, particularly if coupled with high investment and the introduction of new technology.

Consumer electronics

In many respects, the manufacture of television sets, accounting for about half of U.S. consumer electronics employment, can stand for the sector as a whole. Domestic employment in television manufacturing has been falling since the mid-1960's. (See chart 2.) Jobs for production workers dropped by half between 1971 and 1981, despite a near doubling of output, from 5.4 million to 10.5 million television sets. During this period, a dozen U.S. manufacturers either merged with Japanese or European producers or left the business; General Electric's departure, announced late in 1985, will leave only two major U.S. firms. The U.S. industry now includes more than 10 foreign-owned companies. While contributing to the employment totals in the chart, U.S. production by foreign-owned companies such as Sony or Gold Star tends to reflect higher fractions of foreign value-added than the output of American-owned firms such as Zenith or RCA.

As television sales grew, apparent productivity on a unit output basis (measured as annual output divided by the number of production workers) jumped from 150 sets per worker in 1971 to 560 in 1981. In terms of value-added per production worker, productivity was up by about 40 percent—a trend similar to that for consumer electronics as a whole.[6] The productivity improvements came from multiple sources. As color television sets replaced black-and-white receivers, manufacturers introduced more highly automated production processes. Somewhat later, reductions in the number of parts—resulting from solid-state chassis designs—meant reduced labor content. Only 6 percent of the color television sets made in the United States were solid-state models in 1970, but by 1976 essentially all had been redesigned around transistors. The number of parts dropped by half or more—for example, from 1,023 components for a Panasonic color model in 1972 to 488 in 1976.[7] Often, component insertion was mechanized at the same time. A good deal of the productivity growth during the 1970's resulted from these interrelated changes in chassis design and manufacturing methods. Clearly, the causes of the employment declines in television manufacturing extend well beyond import penetration or offshore assembly; the spread

Chart 2. U.S. employment in television manufacturing, 1966–81



NOTE: Data for the 1966–75 period are for all television employment; data for 1976–81 are for color television only.

SOURCE: *International Competitiveness in Electronics* (Washington, DC, Office of Technology Assessment, November 1983), p. 354.

of solid-state chassis designs and automated manufacturing dramatically reduced labor requirements in this sector of the electronics industry. Import competition did have the effect of speeding the changes.

Over the same period, American consumer electronics firms relocated many of their manufacturing operations to low-wage developing countries. While there are no precise numbers on foreign workers employed in these plants, the U.S. Department of Labor believes there may be more than 30,000—a greater number than now employed in domestic television manufacture. As a result, the proportion of domestic value-added dropped during the 1970's; more parts and subassemblies were produced overseas for final assembly in the United States, whether by American- or foreign-owned companies. Given these trends, simply dividing the total output of television sets by the number of employees overstates productivity gains (although value-added productivity adjusts for this). By 1980, the United States imported more than $1 billion worth of circuit boards and picture tubes for color television sets, about one-third of the total value of domestic output. Two basic causes, then, account for the employment decline in television manufacture: greater labor productivity, achieved through product redesigns as well as automation; and transfers of labor-intensive operations overseas. Intense competitive pressures, centered on manufacturing costs, drove both trends.

Improvements in productivity and manufacturing efficiency may eliminate jobs in the short term, but help to slow down job losses over the longer term. In 1974, for example, Matsushita, a Japanese company, bought Motorola's money-losing Quasar television operations. Matsushita invested heavily in automated manufacturing (some of it in Mexico); redesigned Quasar's product line; and reorganized shopfloor operations, with particular emphasis on quality control and employee participation programs. Greater labor productivity and higher quality—stemming from new capital equipment and redesigned products as well as work reorganization—helped save the jobs of several thousand American workers. At the same time, the production process was more automated, cutting into job opportunities. Quasar's investments in Mexico also came at the expense of job opportunities for Americans. But without these steps, Quasar's U.S. plants might have closed—at the cost of many more jobs.

In the Quasar example, impacts on manufacturing efficiency had many sources; it is impossible to isolate and account with any precision for each. As chart 2 and the Quasar example illustrate, rationalization of production may improve manufacturing efficiency and keep some people at work while making others redundant. Prospects for avoiding displacement are far better in U.S. industries that are more technologically dynamic and are expanding more rapidly than consumer electronics. But nowhere can the tradeoffs between productivity and job opportunities be avoided. In general, productivity must rise to improve competitiveness. Unless output expands at least as fast, some jobs will vanish.

Import and offshore production: How important? The U.S. consumer electronics industry has faced strong external competition since the late 1960's, largely from producers in the Far East. Half the U.S. consumer electronics market has been taken by imports; most products still assembled in the United States contain many imported components. Penetration of consumer electronics markets coincided with employment decline. For example, imports of black-and-white television sets rose from one-quarter to three-quarters of U.S. sales over the 1967–77 period. Imports of color television sets peaked in 1976 at a level nearly 10 times greater than in 1967, then dropped because of quotas termed Orderly Marketing Agreements negotiated with Japan, South Korea, and Taiwan.[8] The quotas cut imports roughly in half.

To what extent have imports cost U.S. jobs? First, we must determine the causes of import penetration. Imports may rise because demand exceeds domestic capacity or because consumer preference shifts to foreign-made goods (perhaps they are judged better values). In the first case—exemplified by video cassette recorders, where U.S. capacity is zero—jobs may not be lost directly but the rate of increase in job opportunities may slow. In the second case, typified by imports of Japanese cars and to a lesser extent by sales of television sets, immediate decreases in employment are likely.

Nor are the consequences of offshore production straightforward. Today, the remaining American-owned television manufacturers all operate overseas production facilities. In addition to the attraction of low-wage labor, the U.S. tariff schedules serve to encourage offshore assembly. (Items 806.30 and 807 permit re-imports with duties computed only on foreign value-added.) All wages and salaries paid overseas could be viewed as a loss to American labor and the U.S. gross domestic product. But what if American firms can only lower their costs and maintain or expand their markets by moving abroad? In some cases, American firms may seek offshore production to take advantage of low-cost labor. In other cases (computer plants in Western Europe, for example), U.S. manufacturers may wish to manufacture near their overseas customers.

It is oversimple to argue that the total number of foreign workers engaged in production for shipment to the United States—whether employed by U.S. or foreign firms—represents domestic employment loss. In most cases, U.S. consumer electronics firms had little choice concerning offshore production. Movement abroad was a defensive reaction, not a strategy aimed at expanding markets and improving profitability. To assume that jobs overseas substitute directly for U.S. employment is tantamount to assuming a stable competitive environment—not at all the case. Rather, employment declines followed losses in competitiveness. American firms had higher costs than their rivals. They pursued the obvious route: increases in automation to raise productivity at home, combined with transfers of labor-intensive operations offshore. Only some companies survived; the others left the industry or were purchased by more successful manufacturers. In this complex chain of events, then, import competition must be counted as the primary cause of job losses in the U.S. consumer electronics industry.

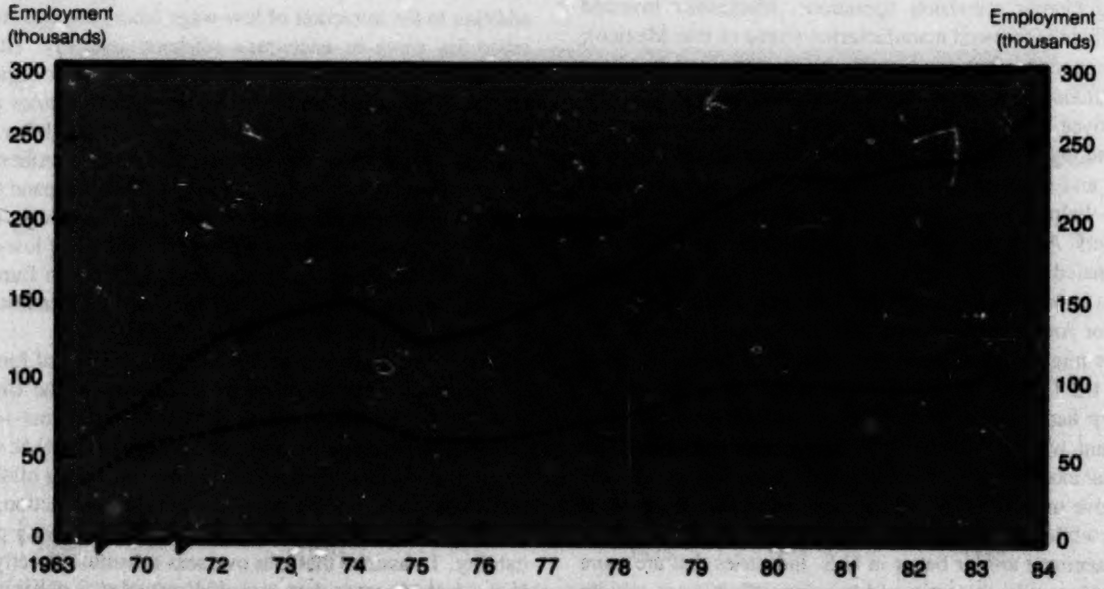
Microelectronics

Since the mid-1950's, U.S. employment in semiconductor manufacture has increased rapidly, from a few thousand when production of transistors was just beginning, to more than 280,000 by the first half of 1985. (See chart 3.) In addition to merchant firms selling on the open market, the totals in the chart include captive production by vertically integrated manufacturers such as IBM and AT&T. During two periods, 1969–71 and 1974–75, employment dropped sharply as a result of recession. Since late 1984, total employment in semiconductors has again been dropping, with the number of production workers falling more sharply. These recent declines come when the economy is not in recession; given the new strength of Japanese competition, it appears that the microelectronics sector has entered a new phase in its evolution.

The proportion of production workers in the U.S. microelectronics industry dropped from 66 percent of the total work force in 1963 to slightly more than 40 percent in 1985. American semiconductor manufacturers, particularly the merchant firms, have been moving labor-intensive assembly operations offshore for years; technological advance has contributed to the shift toward skilled and professional jobs in the United States. Demand for technicians and other nonproduction workers has risen with each succeeding generation of more sophisticated (and expensive) fabrication equipment. With movement through large-scale and now very large-scale integration, design and development of new circuits has become far more complex and time consuming; the ranks of engineering and R&D personnel have grown much faster than those of unskilled and semiskilled production employees.

Imports and offshore manufacturing. In comparing current layoffs, particularly for production workers, with those in previous downturns, one major difference is this: Japanese competition was not a factor during the 1970's. Today, Japanese firms account for substantial fractions of world market share for some types of devices, holding 85–90 percent of the burgeoning worldwide merchant market for 256K RAM memory chips. (Note, however, that this percentage excludes devices produced by such companies as AT&T for internal use.) Furthermore, huge investments by Japanese semiconductor manufacturers over the last few years have created a great deal of overcapacity. This excess

Chart 3. U.S. employment in semiconductors and related devices, 1963–84



SOURCES: *International Competitiveness in Electronics* (Washington, DC. Office of Technology Assessment, November 1983), p. 356; Bureau of Labor Statistics.

capacity, as much as 30 or 40 percent for some types of chips, aggravated the price cutting that has been endemic in the industry. After informal complaints against the Japanese going back a number of years, U.S. semiconductor manufacturers filed three major trade-related complaints with the Federal Government over a 4-month period in 1985. Partly in consequence, Japanese firms have been cutting back on shipments to the United States, while also accelerating their investments here—paralleling their earlier investments in consumer electronics.

Imports are not new to this sector. In 1971, the United States exported twice as many semiconductors as it imported, but by 1982 imports exceeded exports. Do the trends now visible portend job losses? Will employment suffer here as in consumer electronics? The answer is no, at least not over the next decade. There are two reasons. First, despite the current sales slump, worldwide demand for microelectronic devices will continue to grow over the longer term. Although the Japanese have made substantial inroads, American firms retain more than half of worldwide sales, and are still in a position of technical leadership in some if not all varieties of integrated circuits. Second, U.S. semiconductor firms have exported much more agressively than consumer electronics manufacturers. Moreover, about three-quarters of all U.S. imports of microelectronic devices consist of intra-corporate transfers by American-owned firms—that is, re-imports after offshore processing. Offshore employment may continue to rise, and perhaps continue to increase faster than domestic employment, but U.S. jobs in microelectronics should rise as well. Nonetheless, total employment in the sector could continue to grow while the number of production jobs declines.

American semiconductor firms transferred labor-intensive "back-end" operations overseas—primarily assembly steps such as wire bonding and encapsulation—at a rapid pace beginning in the 1960's. During that decade alone, U.S. companies established more than 50 foreign manufacturing plants.[9] Wafers, fabricated domestically, were shipped to low-wage sites, mostly in Asia, for the final stages in processing, then returned to the United States or sent on to other markets. In recent years, U.S. merchant manufacturers have carried out perhaps 90 percent of all assembly work overseas.[10]

The reason is simple. Typical estimates for the 1970's indicated that production costs could be cut in half through offshore assembly.[11] Given these potential savings, cost/price competition became the primary motive for such investments; American semiconductor firms moved offshore to reduce costs and expand markets. Once the first U.S. manufacturer invested in low-wage countries, others followed. With questionable prospects for automation during the 1960's and early 1970's, and a rate of technological advance that threatened to render investments in automated equipment obsolete, the choice was plain: move offshore or be undersold. In contrast to consumer electronics, the competitors in microelectronics were American firms almost exclusively; large-scale foreign investments by U.S. manufacturers predated Japanese thrusts in microelectronics by more than a decade. If in the case of consumer electronics, offshore manufacturing was a reaction to import competition, in microelectronics the motives were offensive.

Because most offshore jobs are filled by assembly workers, overseas manufacturing has contributed to the declining fraction of production employees in the United States. U.S. firms employ perhaps three-quarters as many people in their foreign operations as they do here; but, while only 40 percent of the domestic jobs are in production, the figure is more than 80 percent for offshore plants.[12] As a result, American companies employ many more production workers overseas than at home—roughly 150,000, compared with about 115,000. Although domestic jobs more than doubled during the 1970's, offshore employment grew even faster.

To what extent do foreign workers employed in the overseas operations of U.S. firms, or the employees of foreign-owned companies which export to the United States, stand for job opportunities lost to Americans? In contrast to offshore facilities, most of which are in Asia, point-of-sale plants in industrialized countries have been established largely for strategic reasons: market access, customer liaison, and, sometimes, the avoidance of import barriers. While these point-of-sale plants have arguably small consequences for U.S. employment, offshore investments driven by lower wages directly displace American workers, just as in consumer electronics. Periodically, speculation arises that advances in automated production equipment will mean that American firms can return back-end processing to the United States. With more automation, the labor cost advantages of offshore sites diminish, although they may not vanish. But even when costs remain lower overseas, strategic advantages—similar to those for point-of-sale plants in other industrialized countries—may mean that American companies will bring some of their production back home.[13] If they do (keeping in mind that it is automation that would make this possible), the result is not likely to be an increase in jobs for production workers. Employment is far more likely to increase for engineers, technicians, and supervisors.

The production system. The picture outlined above is not quite so simple as it might seem. Generalizations about the microelectronics industry conceal a good deal of diversity within. Low production costs are far more important for some firms than for others. Companies that depend on product leadership must develop manufacturing systems geared to device technologies pushing the state of the art. Those with broad product lines will place greater stress on costs and quality. Needless to say, no microelectronics manufacturer can neglect costs or quality; the question is one of priorities. Still, unique product designs—for example, a microprocessor with capabilities outstripping those of the rest of the industry—will generate competitive advantages almost irrespective of manufacturing costs.

Nonetheless, in microelectronics as in any industry, unique products remain the exception; generally, manufacturing capabilities are critical for competitive success. Microelectronics, first of all, is an industry where product and process knowhow interact more closely than in perhaps any other. As an example, in mid-1984, Trilogy Systems abandoned its attempts to achieve wafer-scale integration, which would have increased scale and complexity by factors of 100 or more—companies must be able not only to design but to build new types of devices. More than this, quality has become, since the end of the 1970's, central to competitive dynamics. As in many other industries, Japanese manufacturers made quality and reliability a major element in their export strategies. This helped Japanese semiconductor firms penetrate U.S. markets. They concentrated on standard devices such as memory chips, meeting or undercutting the prices of American manufacturers while offering better quality, hence better value.

What does it take to achieve high quality in the production of integrated circuits? Certainly it takes good manufacturing equipment. Japanese semiconductor firms purchased most of their equipment from the same vendors that supplied the U.S. industry; hence they had no advantage on the factory floor as far as equipment was concerned. Integrated circuits from different manufacturers do differ in design, even when functionally identical. Design details influence costs and quality; Japanese firms made design choices aimed at quality and reliability, sometimes at the expense of cost or performance. But more than this, Japan's factory system as a whole—plant layout, integration of people into the production process, task allocations, management style, and internal training and retraining programs—leads to high quality as well as low costs. From a systems perspective, their production processes helped Japan's semiconductor manufacturers to penetrate world markets, competing successfully with American firms that had the lead—and still do—in many functional aspects of circuit design.

Do imports, technology cost U.S. jobs?

Import competition, automation, and offshore investment take place in a context of global shifts in market structure, with long-term consequences for jobs and job opportunities in a national economy, as well as immediate impacts on workers, firms, and industries. In expanding markets, a firm that can respond quickly to new opportunities anywhere in the world may be able to increase exports and consolidate its position. During the 1970's, for example, American semiconductor manufacturers capitalized on the shift toward metal-oxide-semiconductor integrated circuits ahead of their foreign rivals. In doing so, they created many new job opportunities for Americans, unskilled as well as skilled.

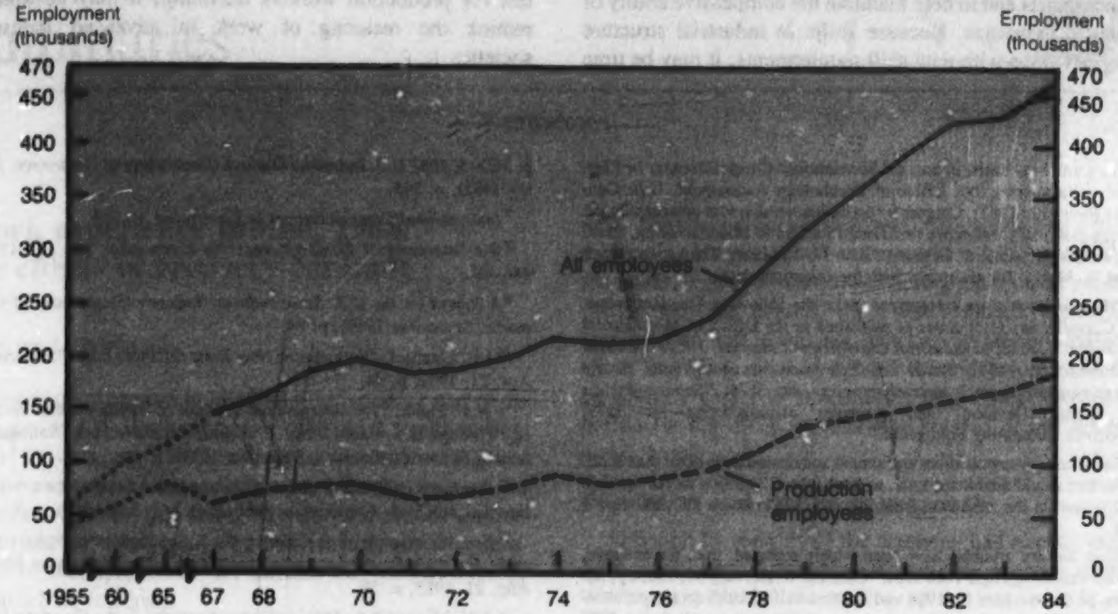
In consumer electronics, particularly television manufacture, the dynamic has been far different. Much of the technology is conventional, accessible to firms in many parts of the world. Markets grow more slowly. In the United States, competition at the retail level has been fierce, with prices declining relative to other consumer durables. As productivity increased, employment declined. Overall, then, while employment in the U.S. electronics industry has grown, the increases have been far from uniform. Few of the workers who once made vacuum tubes found work in microelectronics.

Of course, growth and technological change in electronics also exert influences far beyond this industry. Computer manufacturing, where U.S. competitiveness remains high, has seen rapid employment increase with simultaneous productivity improvements. At the same time, advances in computer systems have created and destroyed vast numbers of jobs in other industries.

Chart 4 illustrates employment growth in computer manufacture, including peripherals. Even more than in microelectronics, the trend has been away from production employees and toward more skilled workers and professionals. Unlike either semiconductors or consumer electronics, neither imports nor offshore production has as yet affected employment greatly. American computer firms have invested heavily overseas, but foreign plants generally serve foreign markets. As in microelectronics, some foreign production may substitute for exports from the United States. But in industrialized (and some developing) countries, American firms often must invest in manufacturing facilities if they expect to sell in volume, limiting the extent to which point-of-sale plants can be viewed as displacing domestic workers. Imports of peripherals and components have been more important; many disc drives and terminals now come from overseas.

In computers, competitive threats lie well in the future.[14] But in consumer electronics, U.S. competitiveness began to slip 20 years ago. Employment typically falls when industries lose ground in either domestic or international markets. Even if aggregate economic growth brings greater demand, only the more efficient companies can take full advantage; firms seldom have any choice but to adopt new technologies, process as well as product, if they wish to remain competitive. Those that move quickly (but not too quickly) may be able to gain an edge over their rivals through efficiency improvements or differentiated product designs. Companies may be forced to automate or pursue alternative routes to lower costs and greater productivity simply to survive. Such strategies have enabled Zenith and RCA, the two largest American color television manufacturers, to maintain their approximate market shares, but to do so, they had to cut their payrolls. If modernizing production facilities and moving offshore costs U.S. jobs in the short term, such strategies may help maintain the total market for American-made products over the longer term.

Chart 4. U.S. employment in computer and peripheral equipment manufacturing, 1955–84



SOURCES: *International Competitiveness in Electronics* (Washington, DC. Office of Technology Assessment, November 1983), p. 359; Bureau of Labor Statistics.

Like all technical change, then, advances in electronics will continue to bring a mix of positive and negative outcomes. Firms manufacturing electronics products will, for some years, continue to create substantial numbers of new jobs. In U.S. manufacturing as a whole, however, jobs—at least for production workers—may go down in absolute terms. A major source of decline in employment opportunities will be redesigned production systems utilizing computers and computer networks along with other tools for improving organizational efficiency.

For firms determined to maintain their competitiveness in world markets while retaining a production base in high-wage economies, computer-assisted automation will be necessary but not, by itself, sufficient. To be successful, these companies will have to redesign their product lines with greater manufacturing efficiency as a primary goal. Product engineers will have to work more closely with manufacturing engineers. Technical staffs will have to work effectively with shopfloor employees—learning from them during the design stage and, at later stages, helping production employees operate the system in something approximating optimal fashion. In the recent past, Japanese companies have done a better job at this than American (or European) firms. Some Japanese firms have nearly erased the interface between design and manufacturing, while building corporate organizations that effectively utilize available human resources, including the capabilities of "unskilled" workers. This has been a major source of Japanese competitiveness in consumer electronics and microelectronics.[15] While we prefer to stress similarities rather than differences between Japanese and Western management styles, it seems clear that the Japanese are well ahead in introducing more highly integrated production systems. A major reason is decision-making processes that lend themselves to conflict resolution and the development of shared values, necessary attributes of integrated systems. Designing products for manufacturing efficiency will be one of the keys to competitive success for American firms over the next few decades. So will integration of workers—at all levels, but particularly on the shop floor—into the production process.

Only by using labor effectively and efficiently—which often means changes both in product design and in the production system—can firms in high-wage economies maintain their international competitiveness. Not all firms will be successful. Some workers, companies, industries, and regions will lose out. Unskilled and semiskilled manufacturing workers are in the greatest jeopardy.

How can the negative impacts be minimized, while capitalizing on the potentials of new technology? The relationships between technical change, employment, and international competition may be complex, but from the standpoint of public policy, many of the negative effects are quite predictable. Adjustment problems cannot be avoided, but governments can prepare for them, both to ease the inevitable shifts and to help maintain the competitive ability of domestic industries. Because shifts in industrial structure bring new jobs with new skill requirements, it may be time to rethink both public and private programs of training, retraining, and education. With jobs and job opportunities for production workers declining, it may be time to rethink the meaning of work in advanced industrial societies. □

Research Summaries

Work experience profile, 1984: the effects of recovery continue

SHIRLEY J. SMITH

The number of persons holding jobs during all or part of the year rose to 121.1 million during 1984, up 3.6 million from 1983. This was the largest single-year increase in 35 years. As the economy continued to improve in the wake of the recession of 1981–82, there were also indications that the work year of those employed had lengthened, the prevalence of unemployment had diminished, and its average duration had lessened.

These findings were derived from the work experience survey, conducted each March as a supplement to the Current Population Survey, the monthly nationwide household survey which measures the changes in the size of the labor force, employment, and unemployment. While the monthly measurements permit officials to closely monitor the pulse of the American economy, the March supplement provides a different perspective. Its retrospective questions covering the entire previous calendar year provide unique information on the labor force behavior of the population, on the extent to which each member, age 16 and over, worked or sought work during the year, and on income derived from employment and other sources.

The work experience profile is particularly informative in describing the labor force activity of groups whose work patterns are discontinuous or habitually irregular. Given the large movements in and out of the labor force each month, the March supplement normally identifies a much larger "economically active population" than does the monthly count. For example, 121.1 million adults were identified in the March 1985 survey as having worked for some period during 1984, while the average of the 12 monthly measurements was just 105.0 million. The total number of persons shown by the March supplement to have been unemployed for some portion of 1984 was 2.5 times as large as was the number encountering unemployment in the average month (that is, 21.5 million versus 8.5 million).

During 1984, the economic recovery took an irregular path. The first half of the year was characterized by a strong surge of employment and corresponding declines in unemployment, both of which slowed during the summer months. During the final quarter, there was a modest upswing in employment, but it was not matched by proportionate declines in joblessness.[1] In light of these developments, it is particularly useful to examine the year's work experience profile for the many persons who entered or left the economic arena.

Population and employment growth

Although by early 1984 the economy had already undergone a full year of recovery, it continued to grow rapidly. Workers appeared to be making up for lost time, both in terms of net entries into the job market and also through shifts to longer work hours. The continuing influx of women into the economic arena, and pressures of population growth, combined with the strong economic recovery to accelerate labor force growth.

The adult population (aged 16 and over) grew by about 1 percent during the year, the pace being roughly four times as great for Hispanics and about twice as fast for blacks as for whites. The following tabulation shows the 1983–84 percent increases in the population aged 16 and over, persons employed at all during the year, and those employed year round, full time, by selected characteristics:

	Civilian noninstitutional population	*Employment*	
		Total	*Full time, full year only*
Total	1.0	3.0	5.5
Men	1.1	2.2	5.7
Women	0.9	4.0	5.2
White	0.8	2.5	5.1
Black	1.7	6.1	7.4
Hispanic	3.3	5.5	6.9

The character of population growth within each group differed, affecting its potential contribution to the work force. The growth of the white population was concentrated in the age range 25 and above, and was offset to a large degree by a contraction of the group 16–24 years of age. The number of black teenagers also declined, but of blacks aged 20 and above, the population increased. The population of Hispanic origin, whose expansion results as much from immigration of adults as from natural increase, registered gains at all ages 16 and over. Hence, the pool from which potential entrants were likely to be drawn was somewhat older for whites than

---

Shirley J. Smith is a demographic statistician in the Office of Employment and Unemployment Statistics, Bureau of Labor Statistics.

for the other two groups. Each demographic group expanded most rapidly within the age range 25–44, where baby-boom cohorts and recent immigrants are concentrated. It is in this age range that life cycle pressures to obtain and hold employment are normally most acute.

As the health of the economy continued to improve, the share of the working-age population holding jobs during the year rose from less than 67 to more than 68 percent, with the pace of growth for women nearly twice that for men. (See table 1.) Nonetheless, because the labor force activity of men has been decreasing in the recent past, even the small increase shown in 1984 is noteworthy.

The number of black and Hispanic workers with full- or part-year jobs was sharply higher in 1984 than in the previous year, reflecting both the very rapid growth of their population and a greater potential for recovery from the recent recession.[2] Whereas the number of whites who were in the labor force at some time during the year grew by 2.5 percent, that of blacks increased by 6.1 percent and Hispanics, by 5.5 percent.

Looked at another way, the growth of the economically "active" population (persons working or looking for work during the year) exceeded that of the total working-age population aged 16 and over, for all groups except men. (See table 2.) The size of the expansion of the year's female work force was more than twice the increase of their entire working-age population. The number of persons who held no job at all during the year declined across the board. Only one group of "inactives," men not looking for work (more than half of whom were retired), showed even minor growth.

Work schedules

A record number of men (43.8 million) and women (26.6 million) held year-round, full-time jobs (50 weeks or more per year, usually at 35 hours or more per week) during 1984. The growth rate of such employment was slightly more rapid for men than for women, and was considerably greater for blacks and Hispanics—with low initial representation in this category—than it was for whites.

Men accounted for about 54 percent of the growth in employment between the last quarter of 1983 and the last quarter of 1984. However, because the work patterns of women are less regular, and their role in the labor force has

[1] Persons of Hispanic origin include whites, blacks, and others (not shown). This ethnic classification is not mutually exclusive from the racial breakdown shown.

been changing more rapidly than that of men, the record of work experience during the year gives quite a different picture of their relative contributions to growth. Nearly 60 percent of the additional 3.6 million persons holding jobs at some time during the year were women. (See table 2.) The proportion of all women reporting jobs rose from 57 percent in 1983 to 59 percent in 1984. The reviving economy also drew an additional 1.4 million men into the work force, raising the proportion of men with jobs to 78 percent.

Most of the year's entrants are, by definition, classed as part-year workers, as few of them manage to work 50 weeks or more. Thus, in a year with large employment increases, one would expect a large increase in the number of part-year workers. The fact that this classification declined by 800,000 for men and grew by less than 1.2 million for women suggests that several million workers with part-year jobs in 1983 had moved on to full-year positions during 1984. Indeed, 2.4 million additional men and 1.3 million additional women reported full-year, full-time work in 1984.

Other evidence of the lengthening work year included a net decline in the representation of men in all less-intense work schedules, and a marked decline in the extent of year-round, part-time employment, especially for women. The modest increase in total part-time employment for women was more than offset by the withdrawal of men from this schedule, resulting in a contraction of the part-time work force. At the same time, full-time employment rose sharply, by more than 3.7 million persons, during the year. More than half (1.9 million) of this net increase was attributable to women.

During 1984, 6 of 10 net entrants to the work force and more than half of the net additions to the full-time work force were women. Yet women contributed only about a third to the increase in year-round employment.

Components of change in employment

The work experience survey adds additional perspective to our understanding of the components of change. It illustrates, for instance, which groups experience disproportionate gains within each work schedule category. For example, whites comprised 70 percent of the growth in the working age population between 1983 and 1984.[3] They supplied 72 percent of the total net growth in employment and were responsible for 77 percent of the growth in full-time employment, 79 percent of the growth in year-round jobs, and 82 percent of the increase in year-round, full-time work. By contrast, blacks made up about 15 percent of the growth in the working age population but accounted for more than two-thirds of the growth in part-year work: a reflection of their continued high unemployment and labor force entry and exit rates, as well as their relatively youthful population. Hispanics (an ethnic group including blacks, whites, and others) accounted for 21 percent of the growth in population. They contributed just 11 percent to overall growth in employment during the year but 30 percent to the part-year work force.

The proportion of men holding jobs during part or all of 1984 was roughly 8 of 10 for both whites and Hispanics, but just 7 of 10 for blacks. Proportionately more white than black women held jobs during the year (59 versus 57 percent). However, black women were more likely than white women to hold year-round, full-time jobs if they did work (54 versus 47 percent). (See table 3.)

Given the secular trend toward early retirement, it was not clear how responsive the elderly workers would be to improvements in overall labor demand. As table 4 indicates, women aged 60 and over showed no greater inclination to hold jobs in 1984 than they had in 1983. There was a modest increase in employment among men aged 60 to 61, but job holding at older ages continued to drop. Yet among those older persons who continued to work, there appeared to be some lengthening of the average work year, with a rise in the proportion of "active" men 55 to 64 and of "active" women 60 to 64 holding year-round, full-time jobs.

Not surprisingly, younger workers—who had experienced the sharpest job cutbacks in the early 1980's—registered significant gains in work experience in 1984, as well as in full-year, full-time employment. Persons 35 to 59, the groups registering the least expansion in these areas in 1984, had experienced the least job loss during the recession.

The unemployment picture

About 21.5 million persons, or 17 percent of all who worked or looked for work during 1984, experienced some unemployment. (See table 5.) This was a marked decline from the peak figure (22 percent) registered in 1982, but still higher than that registered in the 1978–79 period (less than 16 percent). The proportions encountering some unemployment during the year were 18.1 percent for men and 16.5 percent for women. When the added effect of racial disparities is considered, the figures range from about 15 percent for white women to 29 percent for black men. (See table 6.) Values for the Hispanic community, which includes whites, blacks, and others, fell within this range.

Overall, about 16 percent of all whites, nearly 27 percent of all blacks, and about 23 percent of all Hispanics experienced one or more spells of joblessness during 1984. For each group, this was the lowest level recorded since 1979.

The incidence of unemployment during 1984 varied considerably by industry, as the figures below for wage and salary workers show:

Industry	*Percent with unemployment*
Total	15.9
Agriculture	28.8
Mining	23.6
Construction	35.1
Manufacturing	17.2
Durable goods	16.6
Nondurable goods	18.2
Transportation and public utilities	11.4
Wholesale and retail trade	17.9
Finance, insurance, and real estate	9.2
Services	12.6
Public administration	7.5

More than a third of all construction workers and nearly 3 of 10 persons in agriculture reported spells of joblessness, once again establishing these as the industries in which workers are most prone to encounter some unemployment. The decline in unemployment since the recession has been most notable in durable goods manufacturing, where 16.6 percent of the workers encountered some unemployment during 1984, down from 27.6 percent in 1982. The corresponding 2-year decline for construction workers was less than 6 percentage points, and for agriculture, less than 2. Agriculture was the only industry to register an absolute decline in employment between 1983 and 1984.

The extent of unemployment obviously affects the share of the total labor force able to work year round, and this is most apparent when one looks at the data by occupation. As table 7 illustrates, a low unemployment figure (such as was reported by executive, administrative, and managerial occupations, or by farm operators and managers) is likely to be associated with high proportions of year-round, full-time workers. However, the high unemployment occupations (such as the construction trades, operators, fabricators, and laborers) show a greater concentration of workers in part-year schedules.

At most, 4 of 5 workers in any occupational group shown held year-round, full-time jobs. In several occupations, including services (except for the protective services), construction trades, handlers, equipment cleaners and helpers, farmworkers and related occupations, and forestry and fishing occupations, fewer than half worked full time for the entire year. Most of these occupations were characterized by unusually high turnover and high unemployment.

Duration of unemployment. Of those experiencing some unemployment during the year, about 14 percent held no job whatsoever during that period. However, the figure for blacks was nearly 27 percent, reflecting the difficulties which blacks—especially the younger ones—face in finding jobs. (See table 6.)

For the most part, spells of unemployment during 1984 were somewhat shorter than those reported in 1983. The median length of time spent in search of a job (including multiple spells) dropped by 1.4 weeks, to 12.8 weeks. Whites and Hispanics each experienced a 1.6-week reduc-

70 and over	15.6	15.1	6.4	6.7	28.9	28.6	18.9	14.6

tion in the median duration of unemployment. Blacks continued to report the longest spells, and the decline in their median length of unemployment amounted to just one-half week. This apparent stagnation masked the contradictory experiences among men and women. While the median spell for black women diminished by 3.4 weeks, and was the most impressive improvement registered, that for black men actually rose by 1.7 weeks, the only duration figure to rise during 1984.

Unemployment and family income. The following text tabulation shows the median income (exclusive of noncash transfers) for various types of families, by presence or absence of unemployment during the year:

Family structure	*No member unemployed*		*At least one member with some unemployment*	
	Median family income	*Percent in poverty*	*Median family income*	*Percent in poverty*
Married-couple families	$33,960	4.1	$25,713	12.0
Families maintained by:				
Women	17,225	17.8	10,427	41.6
Men	27,083	6.0	17,173	21.9
Persons not living in families	16,320	9.3	8,157	32.7

It should be noted that these groups are far from homogeneous: each has its own age and racial makeup. A disproportionate share of married-couple families are white, whereas families maintained by women are disproportionately black. In general, persons living alone are relatively young or old. And of course, unearned income (such as unemployment compensation, disability, military and Social Security benefits, and earnings on investments) affect each group's median differently.

Still, certain patterns are unmistakable. Within any given group, households are at least twice as likely to be classed as having income below the poverty line if some member experiences unemployment during the year. For example, in the absence of unemployment, less than 18 percent of the households maintained by women were classified as being in poverty. Where some unemployment had occurred during the year more than half qualified as being "in poverty." Even among married-couple households, where the general incidence of poverty is relatively low, the families with some unemployment during the year were much more likely to be in poverty than those reporting no unemployment.

Nonworkers

To round out the picture of economic activity during 1984, it is interesting to consider the segment of the adult population which held no job at all during the year. There were 56.5 million such persons, of which slightly more than two-thirds (68 percent) were women. Only 5 percent of the nonworkers were reported as having made any attempt to find employment during the year. Overall, 3 of 10 nonworkers reported that they were retired, a figure which is proba-

[1] Worked 50 weeks or more.

[2] Worked less than 50 weeks.

NOTE: These data reflect revised estimation procedures and are not comparable to data for prior years. Data for 1983 have been retabulated and differ from data previously published in the December 1984 issue. Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

The single most frequently cited reason for refraining from work was home responsibilities. These were cited by nearly 2 of 3 of the Hispanic women, slightly more than half of the white women, and slightly more than a third of the black women who did not hold jobs. Roughly a quarter of all inactive black and Hispanic men explained their nonparticipation in terms of illness or disability; fewer than 20 percent of white men cited these reasons. Because of their relative youth, blacks and Hispanics were more likely than whites to cite school attendance or inability to find work as the primary cause of their inactivity.

During 1984, there was record growth in the work force, as women, blacks, and Hispanics established stronger footing within the economic arena. However, white men made the most significant gains, especially with regard to year-round, full-time employment.

There was ample evidence of a lengthened work year, both with respect to numbers of weeks worked and a decline

Table 7. Incidence of unemployment, and proportion of workers on various work schedules, by occupation of longest job in 1984

Occupation longest held	Experienced some unemployment	Full year[1]		Part year[2]

in usual part-time schedules. Most demographic groups shared in the year's gains, but black men continued to report very serious unemployment problems. ☐

FOOTNOTES

[1] See Richard M. Devens, Jr., Carol Boyd Leon, and Debbie L. Sprinkle, "Employment and unemployment in 1984: a second year of strong growth in jobs," *Monthly Labor Review*, February 1985, pp. 3–15.

[2] During 1984, the proportion of whites with some employment during the year rose to within half a percentage point of the level registered in 1979. The proportion of blacks with jobs during all or part of the year was a full percentage point below, and for Hispanics, 2.3 percentage points below the figure reported in 1979.

[3] In reality, the population weights and estimates, and age references from the March survey correspond with survivors to that month, rather than all persons alive during the previous year. Thus, year-to-year population growth is measured from March 1984 to March 1985.

Rise in mothers' labor force activity includes those with infants

HOWARD HAYGHE

The notion that mothers of preschool-aged children, especially infants, usually stay out of the labor force at least until their youngest child has entered elementary school has changed rapidly during the 1980's. At mid-decade, nearly half of the mothers are either entering or reentering the work force soon after giving birth. By the time their youngest child is 4 years of age, 60 percent are in the work force. This report introduces a newly expanded series of statistics that traces some of the profound changes that have occurred in the labor force participation rates of the mothers of young children.[1]

Married mothers

In March 1985, nearly half of all wives (husband present) with infant children 1 year old or under were in the labor force, compared with only 31 percent in 1975. The proportion rises significantly until the youngest child reaches school age. Fifty-four percent of the mothers of 2-year-olds were working or looking for work in March, as were 62 percent of those with 5-year-olds. For mothers of school-age children the proportion ranged between 64 and 71 percent.[2] (See table 1.)

Altogether, about 25 million children—over half in married-couple families—are in families where the mother is absent from the home for part of the workday on a regular basis; almost all of these children have a working father (91 percent).[3] This latter fact, when linked to information on the full- or part-time employment status of wives, helps provide some insight into the extent and nature of the demand for child care. In 1985, 65 percent of the employed mothers with children under age 3 worked full time, as did 67 percent of those with children 3 to 5 years old (none younger) and 70 percent of those whose youngest child was 6 to 17.[4]

Race. The labor force participation rates of black married mothers were considerably higher than those of white married mothers, especially when the youngest child was a preschooler. At 64 percent, the participation rate for black mothers with infant children (1 year or under) was 15 percentage points higher than the rate for whites. For the most part, this difference showed few signs of narrowing until the youngest child was 7 years or older. Even among mothers of older children, blacks maintained higher labor force participation rates.

Reasons underlying the higher participation rates of black mothers with very young children are both historical and economic. Black wives have a long history of participating in the labor market to a much greater extent than their white counterparts, impelled in part by the relatively greater labor force difficulties of black than white husbands. In March 1985, for instance, the unemployment rate for black fathers with preschool children was 10.2 percent, compared with 5 percent for the white fathers; for those whose youngest child was of school age, the unemployment rates were 6.3 percent for black fathers and 4.2 percent for white fathers. In addition, median usual weekly earnings of black husbands who were full-time wage and salary earners in the third quarter of 1985 were $353, or 77 percent of the $459 for white husbands.[5]

Along with their generally higher labor force participation rates, employed black mothers usually work more weeks each year than white mothers, and a substantially larger proportion work all year at full-time jobs. This is true for mothers of preschoolers as well as school-age children; among those with children under age 3, 47 percent of the blacks worked year round, full time in 1984, compared with 31 percent of the whites. The proportions were 65 percent (for blacks) and 35 percent (for whites) for those with 3- to 5-year-olds. As a consequence of these marked differences, median earnings of black wives with preschoolers were $10,480 overall in 1984, compared with $7,020 for whites; for wives with school-age children, the earnings were $12,010 (for blacks) and $8,800 (for whites).[6]

However, the higher earnings of black mothers do not translate into higher total *family* income because of the significant difference between the earnings of black husbands and white husbands. The 1984 median income of black married-couple families with preschool children was $22,480, compared with $27,800 for whites.[7]

Single-parent mothers

Because single-parent mothers are often the sole support of themselves and their children, they are far more likely to

be in the labor force than married mothers. But, when labor force participation rates are disaggregated by year of age of youngest child, there is not much difference between the participation rates of the single parents and married mothers when their youngest child is 4 years of age or under, except among those with infants. (See table 2.) However, the dif-

ferences begin to widen when the youngest child is 5 years old, and for the most part, remain large among mothers of older children.

In addition to having higher labor force participation rates than married mothers, single-parent mothers are also more likely to be full-time workers. About 82 percent of employed single-parent mothers worked 35 hours or more a week in March 1985, compared with 68 percent of married mothers. Proportions of single-parent mothers working full time ranged from 79 percent of those with children under 3 years, to 84 percent of those whose youngest child was age 6 to 17.

The relationship between the participation rates of whites and blacks among single-parent mothers is the reverse of that among married mothers. That is, white single parents are somewhat more likely than their black counterparts to be working or looking for work. However, until the youngest child enters his or her teens, the difference between participation rates for white single parents and black single parents is not nearly as great as among married mothers.

Trends since 1970

As table 3 shows, labor force participation rates of all wives by single year of age of youngest child increased between 1970 and 1985 whatever the child's age, though to differing degrees. Overall, labor force participation rates of married mothers grew faster during 1975 to 1980 than in either the 1970–75 or 1980–85 periods.

The most rapid increase from 1970 to 1985 was among mothers of very young children. Participation rates of mothers of infants age 1 year or under about doubled, followed by a 77-percent jump for those with 2-year-olds and a 60-percent rise for mothers of 3-year-olds. In contrast, the already high participation rates of mothers of older children grew less rapidly. For instance, the rates for mothers of 6- to 13-year-olds rose by 45 percent with the more rapid growth (increases in the 50-percent-plus range) occurring among mothers of 6-, 7-, and 8-year-olds. Mothers of 14- to 17-year-olds showed the least gain in participation rates—about one-fifth.

Table 3. Labor force participation rates of wives, husband present, by age of youngest child, March of selected years, 1970–85

Presence and age of child	1970	1975	1980	1985
Wives, total	40.8	44.5	50.2	54.3
No children under 18	42.2	44.0	46.0	48.2
With children under 18	39.8	44.9	54.3	61.0
Under 6 years, total	30.3	36.8	45.3	53.7
Under 3 years, total	25.8	32.6	41.5	50.7

14 to 17 years, total	54.8	53.8	60.5	67.0
14 years	56.9	52.4	62.5	70.3
15 years	52.8	54.7	60.8	67.9
16 years	54.3	55.0	62.3	64.2
17 years	55.1	52.7	55.6	64.9

NOTE: Children are defined as "own" children of householder and include never-married sons, daughters, stepchildren, and adopted children. Excluded are other related children such as nieces, nephews, or grandchildren, and unrelated children.

The result of these differing rates of change has been a convergence of participation rates and a blurring of the correlation between mothers' labor force activity and age of youngest child. For instance, in 1970, the highest participation rate (57 percent for mothers of 14-year-olds) was more than twice the lowest rate (24 percent for those with infants). By 1985, the highest rate (71 percent for mothers of 12-year-olds) was less than half again larger than the lowest rate (49 percent for mothers of infants).

THESE STATISTICS point to some of the striking changes in the economic role of mothers over the last decade and a half. Families have increasingly become solely or partly dependent on a mother's earnings. Using this newly expanded data series by single year of age of children, researchers will be better able to monitor changing labor force trends and thus provide important insights regarding family economic structure and the demand for family services such as child care. □

FOOTNOTES

[1] Labor force participation rates were previously disaggregated by the age *group* of the youngest child of the working mother; however, now they are also disaggregated by the *single* year of age of the youngest child.

The data in this research summary are derived from information collected each March in the Current Population Survey (CPS). The CPS is a monthly household survey (presently including 59,500 households) conducted for the Bureau of Labor Statistics by the Bureau of the Census. Information obtained from this survey relates to the employment status of the noninstitutional population 16 years old and over.

Because it is a sample survey, estimates derived from the CPS may differ from the actual counts that could be obtained from a complete census. Therefore, small estimates or small differences between estimates should be interpreted with caution. For a more detailed explanation, see the Explanatory Note in *Families at Work: The Jobs and the Pay*, Bulletin 2209 (Bureau of Labor Statistics, 1984), pp. 30–34.

[2] Labor force statistics on mothers of school-age children may partly reflect the fact that they are collected in March when school is in session. However, participation rates based on March data are not substantially higher than those based on information collected in the summer. For example, the June to August 1985 average participation rate for married mothers with school-age children was 65 percent; in March 1985, the rate was 68 percent. Thus, the opening of school does not appear to provide a major incentive for mothers to participate in the labor force.

Foreign Labor Developments

West German labor unrest: are unions losing ground to worker councils?

CHARLES J. HOBSON AND JAMES B. DWORKIN

In the years following World War II, West Germany has emerged as one of the world's strongest industrial powers. Traditionally, the German economy has enjoyed a strong rate of economic growth and high levels of productivity, coupled with low inflation and unemployment.

A great deal of the credit for this "economic miracle" has often been attributed to the cooperative labor relations system in West Germany. Rejecting the adversarial industrial relations framework which has evolved in the United States, the Germans have relied on a cooperative partnership between government, labor unions, and employers to foster a strong shared commitment to economic growth. Labor conflicts have been minimized and days lost to strike activity are among the lowest in the world.

Components of the system

By law, industrial relations in West Germany is practiced within the framework of two separate sub-systems. On the one hand, national legislation has provided for a comprehensive and participatory structure for representing worker interests at the company or plant level, which is specifically referred to as codetermination and uniquely characterizes the German approach. At the industry level, on the other hand, a system of collective bargaining exists which is similar yet reduced in scope to that found in the United States.[1]

The legislated codetermination structure provides for representation of worker interest at three distinct levels: worker councils, labor directors, and worker-elected members on the board of directors. In practice, the German system functions as follows. Worker councils are required in all plants having five employees or more, with the size of the council based upon the number of employees. These councils have rather broad, far-reaching powers, which include an equal say with management in (1) job evaluation, (2) overtime, breaks, and holiday schedules, (3) recruitment, selection, and dismissal, and (4) training and safety. Strikes over these matters are prohibited by law, and disputes are usually resolved through binding arbitration.

The second level of the codetermination structure involves the labor director who, as a member of the company's management team, is in charge of day-to-day operations. As a representative of the interests of the workers, the labor director is responsible for the personnel and social policies and practices of the company.

Finally, the third level of representation in the codetermination structure consists of worker-elected members of the company's board of directors. In many instances, boards are made up of an equal number of worker and stockholder representatives. Boards are charged with electing a chairperson who, in the event of a tie, votes twice. If the board is deadlocked on the choice of a chairperson, a simple majority of the stockholders' representatives is sufficient for election. Thus, while parity board representation is often championed as an important feature of the German system, the provisions for electing a chairperson and breaking ties effectively ensure that stockholders' interests will prevail even when the board as a whole is deadlocked.

The second major component of the German industrial relations framework is the collective bargaining system, which takes place primarily at the state and national or industry-wide level. Labor-management negotiations are concerned exclusively with two issues, wage levels and a rather nebulous area called "general conditions of employment." Only for disputes relating directly to these two negotiable issues can strikes legally be called. While relatively influential at the national level, German unions are by comparison very weak at the plant level. In fact, unions have no legal right to represent workers locally and thus defer power and control over plant issues to worker councils.

In summary, in terms of formal structure, industrial relations in West Germany is conducted in two seemingly separate spheres, with unions playing a far less influential role than they do in the United States. However, in practice, there is substantial overlap and coordination between the codetermination components and the collective bargaining system. For instance, more than 80 percent of all worker council representatives are union members. Therefore, unions tend to play a more important role in the industrial relations framework than is evident on the basis of the formal structure of the system.

Recent developments. The strong economy and relative labor peace experienced in West Germany have been

---

Charles J. Hobson is an assistant professor of management at the Division of Business and Economics, Indiana University Northwest, and James B. Dworkin is an associate professor of industrial relations at the Krannert Graduate School of Management, Purdue University.

seriously threatened by the recent worldwide recession. The economy has been confronted with a dramatic decrease in the growth of gross national product, higher inflation, and an unsettling increase in unemployment.

Labor unions were forced to accept minimal wage increases and modest programs to guarantee job security to senior workers. The general conciliatory stance of German labor changed dramatically in the summer of 1984, when I G Metall, the country's largest union with more than 2.5 million members, staged a bitter and protracted 8-week strike in an effort to win a 35-hour workweek with no decrease in pay. The stated union objective was to reduce national unemployment by 1 percentage point to 8 percent of the labor force.

The strike was resolved with a reduction of 1.5 hours in the workweek and no corresponding reduction in pay. However, the long strike had a devastating impact on the German economy. Involving more than 350,000 workers, the strike cost German auto companies more than $75 million per day in lost production and reduced gross national product by an estimated 2 percent. A number of firms laid off other workers in an effort to cut costs and make up for sagging productivity rates. Finally, the union's action generated a great deal of adverse public opinion.

Why had I G Metall broken with past tradition and bargained in an uncharacteristically antagonistic and unyielding manner? Surely, the projected economic costs of the impending strike were known to union leaders prior to their action. Why then did they risk upsetting the fledgling German economic recovery from the recent recession?

A glimpse into the possible dynamics of this scenario can be obtained by addressing the perceptions of German workers as to the relative usefulness and necessity of the union and codetermination components in representing labor interests. A comparison of the perceptions of these institutions could shed light on the secondary position occupied by German unions as they begin to lose their influence among German workers.

Scope of the study

The present study is part of a larger research effort which involved three major components: (1) questionnaire development, (2) questionnaire administration, and (3) questionnaire analysis.[2] The development of the questionnaire was a collaborative, cross-cultural effort involving both the German and American members of the research team. It was designed to collect the following information from German workers: (1) basic biographical data, (2) job satisfaction indices, and (3) attitudinal/perceptual measures concerning the various components or participants in the codetermination system—unions, management, worker councils, labor directors, and worker representatives on corporate boards.

Questionnaire administration was a coordinated effort involving the German labor unions, company managements, worker council representatives, and the German member of the research team. Questionnaires were distributed to five large firms in the automobile and metal industries in the Munich area of West Germany. Responses were entirely voluntary and a total of 135 completed questionnaires were collected, for a response rate of 40 percent.

The questionnaire responses were analyzed from the perspective of implications for German unions in particular and the national labor relations system in general. Specifically, mean responses to the items comprising the union scale were computed and compared with similar items on the three scales representing the codetermination structure—worker councils, labor directors, and worker representatives on corporate boards. In this manner, the psychological perceptions of employees as to the relative usefulness and merits of the various components representing worker interests in the German industrial relations system can be examined.

The findings

The results of this study are summarized in tables 1 and 2. In table 1, the individual items on the four scales measuring worker attitudes towards the union, worker council, supervisory board members, and the labor director are presented. All items were measured on a 1 to 5 scale, from "strongly disagree" to "strongly agree." Item means and standard deviations are also provided in table 1.

The data in table 1 indicate that German workers place relatively little value on the labor director component of

Table 1. Attitudinal measures of German workers toward unions and three codetermination components

Item	Response rating[1]	Standard deviation
Union:		
The union is essential in representing worker interests ...	4.25	1.13

To better promote worker interests, it would be a good idea to increase the power of the labor director	2.70	1.49

[1] The response format for all items was: "1" = Strongly disagree
"2" = Disagree somewhat
"3" = Neither agree nor disagree
"4" = Agree somewhat
"5" = Strongly agree

Table 2. Means differences and *t*-tests of worker perceptions by issue

Issue[1]	Union mean	Worker councils mean	Degrees of freedom	*t* value	Probability
This institution is essential in representing worker interests	4.25	4.47	133	2.93	p. < 01
This institution has done a lot to help workers in my company	3.91	4.13	129	2.12	p. < 05
To better promote worker interests, it would be a good idea to increase the power of this institution	3.72	4.18	133	4.95	p. < 01

[1] For the exact wording of these issues on the union and worker councils subscales, see table 1. The issues were measured using a 1–5 scale in which:
"1" = Strongly disagree
"2" = Disagree somewhat
"3" = Neither agree nor disagree
"4" = Agree somewhat
"5" = Strongly agree

their industrial relations system. In contrast, a higher positive value is associated with unions, worker councils, and supervisory board members. Interestingly, however, in terms of best representing and promoting worker interests, worker councils are perceived as more valuable and effective than unions.

Table 2 provides a direct comparison of means on three similar issues from the union and worker council scales. Correlated *t*-tests of the differences between these means are also provided, along with the associated degrees of freedom and probability levels. The data indicate that in each of the three cases, the worker council is viewed as significantly more essential and useful than the union.

The results of this study are suggestive of a hypothesis which warrants further investigation—namely, the assertion that German labor unions are responding to an erosion of support among rank and file members by bargaining more aggressively and antagonistically in an effort to justify their existence. From the perspective of German workers surveyed in this study, the worker council emerges as the most important institution representing worker interests, with unions occupying a secondary position.

Ironically, the situation which has developed in Germany is not unlike that which has evolved in the United States over the last few years. During the 1980–82 recessionary period, the trend towards union "givebacks" and concessionary contracts led to increasing disillusionment among union members. This in turn has significantly contributed to an increase in the number of decertification elections and the percentage won by management.

In West Germany, no formal legal procedures exist to certify or decertify a union. However, the right to organize is guaranteed in the constitution, and it is assumed that company management will negotiate with an existing employees' union over the mandatory bargaining issues.

Individual workers are free to join or not join a company union and thus an "open shop" is required throughout the country. In addition, all company workers, including both union and nonunion employees, are covered by the terms of an existing labor contract. Given these conditions and the standard union dues rates of 2 percent of total wages, it is not surprising to find that total union membership in West Germany is declining.

It should be noted that this study is cross-sectional in nature and is further limited by the relatively small sample size of 135. Thus, generalizations based upon the obtained results should be made cautiously. Furthermore, in the notable absence of comparable, scientifically collected historical data,[3] it is not possible to delineate a trend towards growing disillusionment with labor unions in West Germany. Future research should focus on the collection of longitudinal data which would allow for the identification and charting of general trends in worker perceptions and attitudes. ☐

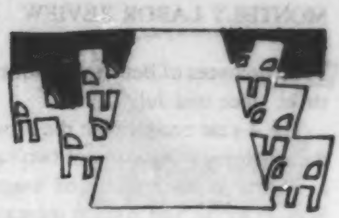
Developments in Industrial Relations



General Dynamics workers end 2-month strike

Production of armored vehicles resumed at General Dynamics Corp. plants in three States after members of the United Auto Workers union narrowly approved a 31-month agreement, ending a 2-month strike. The low margin of approval (53.4 to 46.6 percent) was attributed to employee dissatisfaction because the accord did not bring them to wage parity with employees of Chrysler Corp., which had owned the plants until 1982. Reportedly, they will remain about $1.50 an hour behind the Chrysler workers and could fall farther behind because their cost-of-living pay adjustment formula is less liberal than that at Chrysler. According to a union official, the General Dynamics workers averaged about $11.92 an hour under the old contract.

Wage terms included a $2,000 lump-sum payment; a 2.25-percent wage increase effective immediately; a lump-sum payment in June 1986 equal to 2.25 percent of earnings during the previous 12 months; and a 3-percent wage increase in June 1987. Quarterly cost-of-living adjustments will continue, calculated at 1 cent an hour for each 0.3-point movement in the CPI-W (1967=100), compared with 1 cent for each 0.26-point at Chrysler. In another difference, newly hired workers at General Dynamics will receive only the adjustments in the cost-of-living allowance that occur after they start work.

The new hires will continue to start at 60 percent of the standard rate for their job, and then receive 8-percent progression increases every 6 months until they attain the standard rate after 2½ years of service. Previously, new employees received 6.5-percent step increases each 6 months, attaining the standard rate after 3 years.

The agreement, scheduled to expire on June 15, 1988, also provided for a $2.25 increase, to $19.75, in the monthly pension rate for each year of credited service; and for continuation of the health insurance plan without any increases in co-insurance and deductible payments by employees.

Carrier contract features cost-reduction changes

Carrier Corp. of Syracuse, NY, and the Sheet Metal Workers negotiated a number of cuts in labor costs because of the "very competitive market" in the heating, air conditioning, and ventilating industry, according to company vice president Joseph P. Matturro. Although Carrier was operating at a profit prior to the cuts, Local 27 president Richard Burke said the employees accepted the reductions "to save our jobs." At the time, 2,000 members of the local were employed and 800 were on layoff.

Pay, which reportedly averaged about $13 an hour, was cut by $1.88 to $2.88, varying by job classification. The 3-year contract did not provide for any specified wage increases, but the employees will receive a $3,500 lump-sum payment in January 1986. Carrier guaranteed that if any plant shutdowns occur, affected employees will receive a payment equal to the earnings they gave up, less the $3,500.

The cost-of-living provision was revised to provide that quarterly adjustments will be paid only if the CPI rises more than 3 percent, and each adjustment will be limited to 8 cents an hour.

The other cost reduction changes included 6 percent (maximum 85 cents an hour) shift differential pay, instead of the previous 10 percent with no hourly limit; about 125 job classifications, instead of more than 400; 22 company-paid union representatives, instead of 75; a shortened grievance procedure, involving fewer people; authority for the company to operate on a 7-day-a-week schedule, with no premium pay for weekend work and to require employees to work up to 18 Saturdays a year; and a health care cost containment plan including increased deductible payments by employees.

Other terms included a $2 increase (to $19) in the monthly pension rate for each year of credited service; a plan that will give employees 50 percent of cost savings resulting from productivity improvements; an employee savings plan with Carrier matching half of employee contributions of $2 to $10 a week; an $1,800 tutition allowance for retraining laid-off workers with at least 5 years of service; and a $1,100 relocation allowance for laid-off workers with 2 years of service.

Pennsylvania mine workers settle

After 3½ months of difficult negotiations and selective strikes, members of District 25 of the United Mine Workers settled with the Anthracite Coal Operators Association for mines located in Northeastern Pennsylvania. About 1,000 workers were involved. Separate bargaining continued for

---

"Developments in Industrial Relations" is prepared by George Ruben of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

350 employees of Bethlehem Mines Corp., who had been on strike since mid-July.

The 4-year accord with the Association, which followed the employees' rejection of two earlier offers, provided for a 30-cent-an-hour specified wage increase retroactive to September 20, and 20-cent increases in September of 1986, 1987, 1988, and for a cost-of-living adjustment of up to 5 cents in September 1988. Prior to the settlement, pay rates ranged from $10.10 to $12 an hour. One of the major issues in the talks was resolved when the parties agreed to continue a 7-hour workday (excluding lunch time). The operators had been seeking to add an hour at straight-time pay.

Benefit changes included adoption of a dental plan, with no deductibles; $180 a week sickness and accident pay (formerly, $150); $75,000 major medical coverage (formerly, $50,000); $10,000 life insurance (formerly, $7,500); and $750 pay for the miner's annual 2-week vacation (formerly, $685).

Boston hotel and restaurant workers settle

A scheduled strike by 4,000 employees was averted when the Greater Boston Hotel Association and the Hotel Employees and Restaurant Employees settled on a 3-year contract. Pay, which reportedly averaged $3.10 an hour for tipped employees and $5.10 for nontipped employees, was raised by 6 percent at the beginning of each contract year. Other changes included a 25-percent increase in the hotels' contribution to the health and welfare trust fund to permit continuation of current benefits without an increase in the employee contribution; adoption of legal services and eye care plans; an additional paid holiday; a fourth day of sick leave per year; a $20 a week increase, to $120, in long-term disability benefits; a 2-cent-an-hour increase, to 18 cents, in the employees' contribution to the pension plan; and a revision of the paid vacation schedule to provide 3 weeks after 7 years of service (was 10), 4 weeks after 17 years (was 20), and a fifth week after 25 years.

The agreement also provides for a stronger antidiscrimination policy, changes to assure more promotions from within the bargaining unit, and for employers to hold annual seminars for supervisors and employees on sexual harassment.

The settlement covered the nine hotels comprising the Association but, based on past practice, five other hotels were expected to agree on similar terms.

Textile workers give company 2-year 'loan'

The expected closing of the Nation's largest rayon mill was averted when Local 371T of the Clothing and Textile Workers and Avtex Fibers agreed on a 2-year contract calling for a cut in labor costs. Avtex contended that the cut was necessary to enable it to compete more effectively against lower cost foreign producers. A company official said the concessions by the 1,500 employees make the Front Royal, VA, plant, "very, very competitive in cost."

The 2-year agreement provided for an immediate wage reduction of $1 an hour and reductions in cost-of-living payments and paid vacations. According to the union, the average worker, who earned $8.14 an hour prior to the settlement, will give up about $4,000 over the contract's term. In a departure from the usual practice when pay is cut, the concession is in the form of a loan. Avtex guarantees to repay the money, plus 8 percent interest, within 2 years after the contract expires, even if the plant is sold or closed.

At the time of the settlement, the plant was operating at about 70 percent of capacity. At its peak, in the 1940's and early 1950's, the plant employed more than 4,500 people.

Earlier in 1985, Avtex had closed a rayon plant in Meadville, PA, that had 600 employees. The company maintained that the plant was modern and efficient but that "imports absolutely chewed us up."

Philadelphia newspaper strike ends

In Philadelphia, a 6½-week strike by 4,500 workers against the *Daily News* and *Inquirer* newspapers ended when the last of nine unions ratified their 4-year agreements. The major issues in the dispute were the size of the economic package and management's desire to introduce automated machines for inserting extra sections into the paper, replacing the hand insertion process performed by mailers.

The accord provides for economic improvements averaging $150 a week over the term, with the allocation between wages and benefits varying by union. Prior to the settlement, weekly pay rates for experienced employees were $671 for reporters, $510 for press operators, $494 for mailers, $470 for delivery drivers, and $283 for messengers.

On the automation issue, management and the Mailers union agreed to study the staffing needs of the new equipment for 17 months while it is being installed. Management will then submit a staffing plan. If the union is not satisfied with the plan, it can force the issue into binding arbitration.

Employees accept pay cut for company stock

Financial difficulties continued at some trucking companies, as 85 percent of the 11,000 employees of Ryder/PIE Nationwide Inc. agreed to a 15-percent pay cut to last for 5 years. In exchange for the cut, which is expected to save the company about $255 million, the workers will receive shares of company stock that could rise to 49 percent of the total shares if all employees decide to participate. Before making the offer to the individual workers the company discussed it with the Teamsters and other unions that represent the employees. □

Book Reviews

Bringing East and West together

Partners in Prosperity. By Julian Gresser. New York, McGraw-Hill Book Co., 1984. 379 pp. $15.95.

In this book, Julian Gresser, an attorney with experience in Japan and the United States, attempts to do several things. He argues that the United States needs an industrial policy, because future economic growth will depend extensively on the development of strategic industries. He suggests that industrial policy played an instrumental role in Japanese growth during the period of rapid expansion, and that it provides a model for U.S. policy. He proposes a "trigger" method, based on his own consulting work, for the identification of strategic industries and their cooperative encouragement by public and private authorities. Although he sees the Japanese and U.S. relationship caught up in a zero-sum mentality, he believes it should be converted to one of cooperation—hence the book's title.

The key to understanding the book is found in the author's views on national industrial policy. Gresser believes that the key to economic growth is not found in mundane areas of increased capital and labor resources. Rather, he believes that it lies in technological innovations which give rise to leading or strategic industries, which in turn become the engines of future growth. In his opinion, this is the essential explanation for Japan's rapid growth in the postwar years. Yet, he argues, industrial policies designed to do for the United States what the Ministry of International Trade and Industry did for Japan cannot be expected to work because of bureaucracy and a failure to develop the cooperation of the essential parties. What is needed is an approach derived from the trigger method.

The trigger method identifies strategic industries in terms of their boundaries in time and space. They are industries with high rates of growth in exports, employment, and product gains. They have substantial commitments to research, capital investment, and innovation, and can be expected to have sharply increasing economies of scale. They significantly affect in a positive way the output levels of other industries, for example, English coal in the early days of the Industrial Revolution. The trigger method also forms the basis for planning without planning, essentially a process of negotiating with the various interested parties an investment strategy for new strategic sectors.

Two chapters deal with issues of Japanese-American conflict and the possibility for cooperation. The United States is described as having a policy of cooperation and equality at high national levels and a much less generous approach when it comes to specific issues. The author reasons that Japanese policy is based on a refusal to view the needs of others as genuine, and on a mercantilist approach to gaining power. The attitudes of the two countries, he believes, lead to a zero-sum game whose results can only be unfortunate for both countries. Because the author believes that cooperation will result in greater growth and wealth for both countries, he suggests ways that this result might be achieved.

How should the book be evaluated? There are three central questions. Are strategic industries the key to growth? Can one identify and nurture the new ones along? Would joint nurturing by Japan and the United States be a wise policy?

My difficulty with the emphasis on strategic industries and the trigger method is that these concepts seem to be more effective in looking backward than forward. The automobile industry is listed as a strategic industry. But when did it become one? Was it in the mid-19th century or not until the 20th century? Clearly later, but when? At that time, would there have been agreement that automobiles had achieved the status of a strategic industry? Even the Japanese Ministry of International Trade and Industry did not recognize automobiles as a strategic industry. Although the Ministry of International Trade and Industry played an important role in Japanese growth, the author, along with others, gives too much credit to the Ministry. In addition, he does not adequately count the costs of errors by the Ministry. (See Kozo Yamamura, ed., *Policy and Trade of the Japanese Economy: American and Japanese Perspectives.)*

Chapter 9 on "planning without planning," in which the emphasis is on trying to bring competing industries with potential for conflict together to find a basis for cooperation, contains an interesting discussion and can be recommended independently of the book as a whole. Similarly, the chapter in which cooperation rather than conflict is proposed for future Japanese and American relations can be commended both for its spirit and for some of its ideas.

On balance, the book contains many interesting facts on specific industries and practices. The interpretation of events seems too much patterned by the idea of a lawyer's brief which tries to make a case, while too little attention is given to alternative and competing explanations. The range of facts is interesting, though at times there is a jumbled quality about them. For example, two pages contain major paragraphs discussing microprocessor designs, the ratio of debt to equity in the financing of Japanese corporations, and the role of city banks in the Japanese banking system.

This book is recommended to those interested in the economic relationship between Japan and the United States. Undue reliance, however, should not be placed on its explanations and interpretations of events. Lastly, there are some useful suggestions for the development of U.S. economic policy, though the central message in favor of a form of planning based on strategic industries leaves me unconvinced.

Atran Professor of Economics
Brandeis University

A mix of encyclopedia and commentary

The Population of the United States: Historical Trends and Future Projections. By Donald J. Bogue. New York, The Free Press, 1985. 728 pp. $70.

This is a well written but expensive reference book on the population of the United States. Donald J. Bogue provides historical perspective, covering the U.S. population over the past two centuries, but he concentrates his analyses on the past two decades, with particular emphasis on the early 1980's. He also discusses future populations trends.

The book is divided into five sections: (1) an overview of the U.S. population; (2) dynamics of population change, such as marital status and migration; (3) social characteristics, for example, ethnicity and educational attainment; (4) economic characteristics, for example, labor force participation, income, occupation, and industry; and (5) special topics, specifically, chapters on poverty, housing, religion, politics, and the population of Puerto Rico. Each chapter of the volume includes a bibliography, and, where appropriate, definitions of terms and technical appendices.

Bogue notes in his preface that work of this type "should select the most cogent information from all available sources, summarize it in easy-to-use statistical tables, and provide a comprehensive exposition of the fundamental details." Overall, Bogue's volume does that. However, there are some inaccuracies in the book. Following are a few examples:

In the chapter on internal and international migration, Bogue states, "World War II caused many millions of people to be 'transferred' from one nation to another. For example, millions of Jews fled from Germany before the war . . ." (p. 356). In fact, there were 550,000 Jews in Germany in the years prior to World War II. (About one-third were later killed by the Nazis.)

There are some discrepancies between the text and the tabulations. For example, the figures do *not* show that the proportion of families in Puerto Rico headed by a female householder with no husband present is nearly identical to that of the U.S. white population (p. 699); that the labor force participation rates of Cuban men and women in the United States are about average for all men and women (p. 493); or that married women with no children have slightly higher labor force participation rates than mothers with children under age 6 (p. 499). (Actually, some of these statements reflect the situation in earlier years.)

It is disappointing that this beautifully produced volume is marred by such inaccuracies.

NOTES ON CURRENT LABOR STATISTICS

This section of the Review presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force, employment, unemployment, collective bargaining settlements, consumer, producer, and international prices, productivity, international comparisons, and injury and illness statistics. In the notes that follow, the data in each group of tables is briefly described, key definitions are given, notes on the data are set forth, and sources of additional information are cited.

General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as "seasonally adjusted." (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. (Seasonally adjusted data appear in tables 1–3, 4–10, 13, 14, and 18.) Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X–11/ARIMA, which was developed at Statistics Canada as an extension of the standard X–11 method previously used by BLS. A detailed description of the procedure appears in *The X–11 ARIMA Seasonal Adjustment Method* by Estla Bee Dagum (Statistics Canada, Catalogue No. 12–564E, January 1983). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. However, revisions of historical data continue to be made only at the end of each calendar year.

Seasonally adjusted labor force data in tables 1 and 4–10 were revised in the February 1986 issue of the *Review* to reflect experience through 1985.

Annual revisions of the seasonally adjusted payroll data shown in tables 13, 14, and 18 were made in July 1985 using the X–11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in table 42 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data—such as the Hourly Earnings Index in table 17—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The $2 (or any other resulting values) are described as "real," "constant," or "1967" dollars.

Additional information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule preceding these general notes. More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in *Employment and Earnings*, a monthly publication of the Bureau. More data from the household survey is published in the two-volume data book—*Labor Force Statistics Derived From the Current Population Survey*, Bulletin 2096. More data from the establishment survey appear in two data books—*Employment, Hours, and Earnings, United States*, and *Employment, Hours, and Earnings, States and Areas*, and the annual supplements to these data books. More detailed information on employee compensation and collective bargaining settlements is published in the monthly periodical, *Current Wage Developments*. More detailed data on consumer and producer prices are published in the monthly periodicals, *The CPI Detailed Report*, and *Producer Prices and Price Indexes*. Detailed data on all of the series in this section are provided in the *Handbook of Labor Statistics*, which is published biennally by the Bureau. BLS bulletins are issued covering productivity, injury and illness, and other data in this section. Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

Symbols

p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally, this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.
n.e.s. = not elsewhere specified.

COMPARATIVE INDICATORS

(Tables 1–3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-to-population ratio, and unemployment rates for major demographic groups based on the Current Population ("household") Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonagricultural payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on **changes in compensation, prices, and productivity** are presented in table 2. Measures of rates of change of compensation and wages

from the Employment Cost Index program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; and the overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data. For detailed descriptions of each data series, see BLS *Handbook of Methods*, Volumes I and II, Bulletins 2134-1 and 2134-2 (Bureau of Labor Statistics, 1982 and 1984, respectively), as well as the additional bulletins, articles, and other publications noted in the separate sections of the *Review*'s "Current Labor Statistics Notes." Historical data for many series are provided in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). Users may also wish to consult *Major Programs, Bureau of Labor Statistics*, Report 718 (Bureau of Labor Statistics, 1985).

EMPLOYMENT DATA

(Tables 1; 4–21)

Household Survey Data

Description of the series

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 59,500 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons include (1) all civilians who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. Members of the Armed Forces stationed in the United States are also included in the employed total. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **overall unemployment rate** represents the number unemployed as a percent of the labor force, including the resident Armed Forces. The **civilian unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **labor force** consists of all employed or unemployed civilians plus members of the Armed Forces stationed in the United States. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons who are retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy, and members of the Armed Forces stationed in the United States. The **labor force participation rate** is the proportion of the noninstitutional populaton that is in the labor force. The **employment-population ratio** is total employment (including the resident Armed Forces) as a percent of the noninstitutional population.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 4–10 are seasonally adjusted, based on the seasonal experience through December 1985.

Additional sources of information

For detailed explanations of the data, see BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982) and for additional data, *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). A detailed description of the Current Population Survey as well as additional data are available in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*. Historical data from 1948 to 1982 are available in *Labor Force Statistics Derived from the Current Population Survey: A Databook*, Vols. I and II, Bulletin 2096 (Bureau of Labor Statistics, 1982).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Establishment Survey Data

Description of the series

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by more than 200,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday

and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 12-16 include production workers in manufacturing and mining; construction workers in construction; and for nonsupervisory workers in the following industries: transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for about four-fifths of the total employment on private nonagricutural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earner and Clerical Workers (CPI-W). The **Hourly Earning Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index, introduced in table 17 of the May 1983 issue, represents the percent of 185 nonagricultural industries in which employment was rising over the indicated period. One-half of the industries with unchanged employment are counted as rising. In line with Bureau practice, data for the 1-, 3-, and 6-month spans are seasonally adjusted, while those for the 12-month span are unadjusted. The diffusion index is useful for measuring the dispersion of economic gains or losses and is also an economic indicator.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of May 1985 data, published in the July 1985 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Unadjusted data have been revised back to April 1983; seasonally adjusted data have been revised back to January 1980. These revisions were published in the *Supplement to Employment and Earnings* (Bureau of Labor Statistics, 1985). Unadjusted data from April 1984 forward, and seasonally adjusted data from January 1981 forward are subject to revision in future benchmarks.

Additional sources of information

Detailed data from the establishment survey are published monthly in the BLS periodical, *Employment and Earnings*. Earlier comparable unadjusted and seasonally adjusted data are published in *Employment, Hours, and Earnings, United States, 1909–84*, Bulletin 1312–12 and its annual supplement (Bureau of Labor Statistics, 1985). For a detailed discussion of the methodology of the survey, see *BLS Handbook of Methods*, Bulletin 2143–1 (Bureau of Labor Statistics, 1982). For additional data, see *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Unemployment Data By State

Description of the series

Data presented in this section are obtained from two major sources—the Current Population Survey (CPS) and the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act and the Public Works and Economic Development Act. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

Notes on the data

Data refer to State of residence. Monthly data for 11 States—California, Florida, Illinois, Massachusetts, Michigan, New York, New Jersey, North Carolina, Ohio, Pennsylvania, and Texas—are obtained directly from the CPS because the size of the sample is large enough to meet BLS standards of reliability. Data for the remaining 39 States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates for the 11 States are revised to new population controls. For the remaining States and the District of Columbia, data are benchmarked to annual average CPS levels.

Additional sources of information

Information on the concepts, definitions, and technical procedures used to develop labor force data for States and sub-State areas as well as additional data on sub-States are provided in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*, and the annual report, *Geographic Profile of Employment and Unemployment* (Bureau of Labor Statistics). See also *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982).

COMPENSATION AND WAGE DATA

(Tables 22–29)

COMPENSATION AND WAGE DATA are gathered by the Bureau from business establishments, State and local governments, labor unions, collective bargaining agreements on file with the Bureau, and secondary sources.

Employment Cost Index

Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It uses a fixed market basket of labor—similar in concept to the Consumer Price Index's fixed market basket of goods and services—to measure change over time in employer costs of employing labor. The index is not seasonally adjusted.

Statistical series on total compensation costs and on wages and salaries are available for private nonfarm workers excluding proprietors, the self-employed, and household workers. Both series are also available for State and local government workers and for the civilian nonfarm economy, which consists of private industry and State and local government workers combined. Federal workers are excluded.

The Employment Cost Index probability sample consists of about 2,200 private nonfarm establishments providing about 12,000 occupational observations and 700 State and local government establishments providing

3,500 occupational observations selected to represent total employment in each sector. On average, each reporting unit provides wage and compensation information on five well-specified occupations. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Fixed employment weights from the 1970 Census of Population are used each quarter to calculate the indexes for civilian, private, and State and local governments. These fixed weights, also used to derive all of the industry and occupation series indexes, ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the bargaining status, region, and metropolitan/nonmetropolitan area series, however, employment data by industry and occupation are not available from the census. Instead, the 1970 employment weights are reallocated within these series each quarter based on the current sample. Therefore, these indexes are not strictly comparable to those for the aggregate, industry, and occupation series.

Definitions

Total compensation costs include wages, salaries, and the employer costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as social security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

Notes on the data

The Employment Cost Index data series began in the fourth quarter of 1975, with the quarterly percent change in wages and salaries in the private nonfarm sector. Data on employer costs for employee benefits were included in 1980 to produce, when combined with the wages and salaries series, a measure of the percent change in employer costs for employee total compensation. State and local government units were added to the ECI coverage in 1981, providing a measure of total compensation change in the *civilian* nonfarm economy (excluding Federal employees). Historical indexes (June 1981=100) of the quarterly rates of change are presented in the May issue of the BLS monthly periodical, *Current Wage Developments*.

Additional sources of information

For a more detailed discussion of the Employment Cost Index, see Chapter 11, "The Employment Cost Index," in the *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), and the following *Monthly Labor Review* articles: "Employment Cost Index: a measure of change in the 'price of labor'," July 1975; "How benefits will be incorporated into the Employment Cost Index," January 1978; "Estimation procedures for the Employment Cost Index," May 1982; and "Introducing new weights for the Employment Cost Index," June 1985.

Data on the ECI are also available in BLS quarterly press releases issued in the month following the reference months of March, June, September, and December; and from the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

Collective bargaining settlements

Description of the series

Collective bargaining settlements data provide statistical measures of negotiated adjustments (increases, decreases, and freezes) in compensation (wages and benefits costs) and wages alone, quarterly for private industry and semiannually for State and local government. Compensation measures cover all collective bargaining situations involving 5,000 workers or more and wage measures cover all situations involving 1,000 workers or more. These data, covering private nonagricultural industries and State and local governments, are calculated using information obtained from bargaining agreements on file with the Bureau, parties to the agreements, and secondary sources, such as newspaper accounts. The data are not seasonally adjusted.

Settlement data are measured in terms of future specified adjustments: those that will occur within 12 months after contract ratification—first year—and all adjustments that will occur over the life of the contract expressed as an average annual rate. Adjustments are worker weighted. Both first-year and over-the-life measures exclude wage changes that may occur under cost-of-living clauses that are triggered by future movements in the Consumer Price Index.

Effective wage adjustments measure all adjustments occurring in the reference period, regardless of the settlement date. Included are changes from settlements reached during the period, changes deferred from contracts negotiated in earlier periods, and changes under cost-of-living adjustment clauses. Each wage change is worker weighted. The changes are prorated over all workers under agreements during the reference period yielding the average adjustment.

Definitions

Wage rate changes are calculated by dividing newly negotiated wages by the average hourly earnings, excluding overtime, at the time the agreement is reached. Compensation changes are calculated by dividing the change in the value of the newly negotiated wage and benefit package by existing average hourly compensation, which includes the cost of previously negotiated benefits, legally required social insurance programs, and average hourly earnings.

Compensation changes are calculated by placing a value on the benefit portion of the settlements at the time they are reached. The cost estimates are based on the assumption that conditions existing at the time of settlement (for example, methods of financing pensions or composition of labor force) will remain constant. The data, therefore, are measures of negotiated changes and not of total changes in employer cost.

Contract duration runs from the effective date of the agreement to the expiration date or first wage reopening date, if applicable. Average annual percent changes over the contract term take account of the compounding of successive changes.

Notes on the data

Care should be exercised in comparing the size and nature of the settlements in State and local government with those in the private sector because of differences in bargaining practices and settlement characteristics. A principal difference is the incidence of cost-of-living adjustment (COLA) clauses which cover only about 2 percent of workers under a few local government settlements but cover 50 percent of workers under private sector settlements. Agreements without COLA's tend to provide larger specified wage increases than those with COLA's. Another difference is that State and local government bargaining frequently excludes pension benefits which are often prescribed by law. In the private sector, in contrast, pensions are typically a bargaining issue.

Additional sources of information

For a more detailed discussion on the series, see chapter 10, "Negotiated Wage and Benefit Changes," of the BLS *Handbook of Methods*, Bulletin 2134–1. Comprehensive data are published in press releases issued quarterly (in January, April, July, and October) for private industry, and semi-

annually (in February and August) for State and local government. Historical data and additional detailed tabulations for the prior calendar year appear in the April issue of the BLS monthly periodical, *Current Wage Developments*.

Work stoppages

Description of the series

Data on work stoppages measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of time lost because of stoppage.

Data are largely from newspaper accounts and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate number of work days lost by workers involved in the stoppages.

Days of idleness as a percent of estimated working time: Aggregate work days lost as a percent of the aggregate number of standard work days in the period multiplied by total employment in the period.

Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

Additional sources of information

Data for each calendar year are reported in a BLS press release issued in the first quarter of the following year. Monthly data appear in the BLS monthly periodical, *Current Wage Developments*. Historical data appear in the BLS *Handbook of Labor Statistics*.

Other compensation data

Other BLS data on pay and benefits, not included in the Current Labor Statistics section of the *Monthly Labor Review*, appear in and consist of the following:

Industry Wage Surveys provide data for specific occupations selected to represent an industry's wage structure and the types of activities performed by its workers. The Bureau collects information on weekly work schedules, shift operations and pay differentials, paid holiday and vacation practices, and information on incidence of health, insurance, and retirement plans. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Monthly Labor Review*.

Area Wage Surveys annually provide data for selected office, clerical, professional, technical, maintenance, toolroom, powerplant, material movement, and custodial occupations common to a wide variety of industries in the areas (labor markets) surveyed. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Review*.

The National Survey of Professional, Administrative, Technical, and Clerical Pay provides detailed information annually on salary levels and distributions for the types of jobs mentioned in the survey's title in private employment. Although the definitions of the jobs surveyed reflect the duties and responsibilities in private industry, they are designed to match specific pay grades of Federal white-collar employees under the General Schedule pay system. Accordingly, this survey provides the legally required information for comparing the pay of salaried employees in the Federal civil service with pay in private industry. (See Federal Pay Comparability Act of 1970, 5 U.S.C. 5305.) Data are published in a BLS news release issued in the summer and in a bulletin each fall; summaries and analytical articles also appear in the *Review*.

Employee Benefits Survey provides nationwide information on the incidence and characteristics of employee benefit plans in medium and large establishments in the United States, excluding Alaska and Hawaii. Data are published in an annual BLS news release and bulletin, as well as in special articles appearing in the *Review*.

PRICE DATA

(Tables 30–41)

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Consumer Price Indexes

Description of the series

The Consumer Price Index (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all urban consumer index (CPI-U) introduced in 1978 is representative of the 1972–73 buying habits of about 80 percent of the noninstitutional population of the United States at that time, compared with 40 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 24,000 retail establishments and 24,000 tenants in 85 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 28 major urban centers are presented in table 31. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are measured for the CPI-U. A rental equivalence method replaced the

asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes.

Additional sources of information

For a discussion of the general method for computing the CPI, see BLS *Handbook of Methods, Volume II, The Consumer Price Index*, Bulletin 2134–2 (Bureau of Labor Statistics, April 1984). The recent change in the measurement of homeownership costs is discussed in Robert Gillingham and Walter Lane, "Changing the treatment of shelter costs for homeowners in the CPI," *Monthly Labor Review*, June 1982, pp. 9–14.

Additional detailed CPI data and regular analyses of consumer price changes are provided in the *CPI Detailed Report*, a monthly publication of the Bureau. Historical data for the overall CPI and for selected groupings may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

Producer Price Indexes

Description of the series

Producer Price Indexes (PPI) measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 60,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The stage of processing structure of Producer Price Indexes organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1976, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

Notes on the data

Beginning with the January 1986 issue, the *Review* is no longer presenting tables of Producer Price Indexes for commodity groupings, special composite groups, or SIC industries. However, these data will continue to be presented in the Bureau's monthly publication *Producer Price Indexes*. Series on the net output of major mining and manufacturing industry groups will appear in the *Review* starting with data for July 1986.

The Bureau has completed the first major stage of its comprehensive overhaul of the theory, methods, and procedures used to construct the Producer Price Indexes. Changes include the replacement of judgment sampling with probability sampling techniques; expansion to systematic coverage of the net output of virtually all industries in the mining and manufacturing sectors; a shift from a commodity to an industry orientation; the exclusion of imports from, and the inclusion of exports in, the survey universe; and the respecification of commodities priced to conform to Bureau of the Census definitions. These and other changes have been phased in gradually since 1978. The result is a system of indexes that is easier to use in conjunction with data on wages, productivity, and employment and other series that are organized in terms of the Standard Industrial Classification and the Census product class designations.

Additional sources of information

For a discussion of the methodology for computing Producer Price Indexes, see BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 7.

Additional detailed data and analyses of price changes are provided monthly in *Producer Price Indexes*. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

International Price Indexes

Description of the series

The BLS **International Price Program** produces quarterly export and import price indexes for nonmilitary goods traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts: it includes corporations, businesses, and individuals but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents. With publication of an all-import index in February 1983 and an all-export index in February 1984, all U.S. merchandise imports and exports now are represented in these indexes. The reference period for the indexes is 1977 = 100, unless otherwise indicated.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected quarterly by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S. border for imports. For nearly all products, the prices refer to transactions completed during the first 2 weeks of the third month of each calendar quarter—March, June, September, and December. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined by the 4- and 5-digit level of detail of the Standard Industrial Trade Classification System (SITC). The calculation of indexes by SITC category facilitates the comparison of U.S. price trends and sector production with similar data for other countries. Detailed indexes are also computed and published on a Standard Industrial Classification (SIC-based) basis, as well as by end-use class.

Notes on the data

The export and import price indexes are weighted indexes of the Laspeyeres type. Price relatives are assigned equal importance within each weight category and are then aggregated to the SITC level. The values assigned to each weight category are based on trade value figures compiled

by the Bureau of the Census. The trade weights currently used to compute both indexes relate to 1980.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's quarterly questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

For the export price indexes, the preferred pricing basis is f.a.s. (free alongside ship) U.S. port of exportation. When firms report export prices f.o.b. (free on board), production point information is collected which enables the Bureau to calculate a shipment cost to the port of exportation.

An attempt is made to collect two prices for imports. The first is the import price f.o.b. at the foreign port of exportation, which is consistent with the basis for valuation of imports in the national accounts. The second is the import price c.i.f. (cost, insurance, and freight) at the U.S. port of importation, which also includes the other costs associated with bringing the product to the U.S. border. It does not, however, include duty charges.

Additional sources of information

For a discussion of the general method of computing International Price Indexes, see BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 8.

Additional detailed data and analyses of international price developments are presented in the Bureau's quarterly publication *U.S. Import and Export Price Indexes* and in occasional *Monthly Labor Review* articles prepared by BLS analysts. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

PRODUCTIVITY DATA
(Tables 42–47)

U. S. productivity and related data

Description of the series

The productivity measures relate real physical output to real input. As such they encompass a family of measures which include single factor input measures, such as output per unit of labor input (output per hour) or output per unit of capital input, as well as measures of multifactor productivity (output per unit of labor and capital inputs combined). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

Definitions

Output per hour of all persons (labor productivity) is the value of goods and services in constant prices produced per hour of labor input. **Output per unit of capital services** (capital productivity) is the value of goods and services in constant dollars produced per unit of capital services input.

Multifactor productivity is the ratio output per unit of labor and capital inputs combined. Changes in this measure reflect changes in a number of factors which affect the production process such as changes in technology, shifts in the composition of the labor force, changes in capacity utilization, research and development, skill and efforts of the work force, management, and so forth. Changes in the output per hour measures reflect the impact of these factors as well as the substitution of capital for labor.

Compensation per hour is the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, and the wages, salaries, and supplementary payments for the self-employed (except for nonfinancial corporations in which there are no self-employed)—the sum divided by hours paid for. **Real compensation per hour** is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs is the labor compensation costs expended in the production of a unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current dollar value of output and dividing by output. **Unit nonlabor costs** contain all the components of unit nonlabor payments *except* unit profits.

Unit profits include corporate profits and the value of inventory adjustments per unit of output.

Hours of all persons are the total hours paid of payroll workers, self-employed persons, and unpaid family workers.

Capital services is the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories—weighted by rental prices for each type of asset.

Labor and capital inputs combined are derived by combining changes in labor and capital inputs with weights which represent each component's share of total output. The indexes for capital services and combined units of labor and capital are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

Notes on the data

Output measures for the business sector and the nonfarm business sector exclude the constant dollar value of owner-occupied housing, rest of world, households and institutions, and general government output from the constant dollar value of gross national product. The measures are derived from data supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are developed from data of the Bureau of Labor Statistics and the Bureau of Economic Analysis.

The productivity and associated cost measures in tables 42–44 describe the relationship between output in real terms and the labor time and capital services involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input. Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and efforts of the work force.

Additional sources of information

Descriptions of methodology underlying the measurement of output per hour and multifactor productivity are found in the *BLS Handbook of Methods*, Bulletin 2134, Vol. 1, Chapter 13 (Bureau of Labor Statistics, 1982). Historical data for selected industries are provided in the Bureau's *Handbook of Labor Statistics*, Bulletin 2217, 1985.

International comparisons

Description of the series

Comparative measures of labor force, employment, and unemployment (tables 45 and 46) are prepared regularly for the United States, Canada, Australia, Japan, France, Germany, Great Britain, Italy, the Netherlands, and Sweden. Unemployment rates, approximating U.S. concepts, are prepared monthly for most of the countries; the other measures, annually.

The Bureau of Labor Statistics also prepares international comparisons of manufacturing labor productivity and labor costs (table 47) that cover the United States and 11 foreign countries—those listed above plus Belgium and Norway. These measures are limited to trend comparisons; that is, intercountry series of changes over time, rather than level comparisons because reliable international comparisons of the levels of manufacturing are unavailable. The U.S. measures are described in the notes on U.S. productivity measurement; the measures for foreign countries are compiled from various national and international data sources.

Definitions

Output measures are constant value output (value added) from the national accounts of each country, except for those for Japan prior to 1970 and for the Netherlands for 1969 forward, which are indexes of industrial production. The national accounting methods for measuring real output differ considerably among the 12 countries, but the use of different procedures does not, in itself, connote lack of comparability—rather, it reflects differences among countries in the availability and reliability of underlying data series.

Hours and compensation measures refer to all employed persons including the self-employed in the United States and Canada, and to all wage and salary employees in the other countries. *Hours* refer to hours *paid* in the United States, hours *worked* in the other countries. *Compensation (labor costs)* includes not only all payments made directly to employees and employer expenditures for social insurance and private benefit plans, but changes in significant employment or payroll taxes that are not compensation to employees but are labor costs to employers (France, Sweden, and the United Kingdom). Self-employed workers are included in the U.S. and Canadian figures by assuming that their hourly compensation is equal to the average for wage and salary employees.

Notes on the data

The data for the foreign countries in tables 45 and 46 have been adjusted, where necessary, for greater comparability with U.S. definitions of employment and unemployment. The adjusted statistics have been adapted to the age at which compulsory schooling ends in each country. Therefore, the adjusted statistics relate to the civilian population age 16 and over in the United States, France, and Sweden, and from 1973 onward, Great Britain; 15 and over in Canada, Australia, Japan, Germany, and the Netherlands; and 14 and over in Italy. Prior to 1973, the data for Great Britain related to persons age 15 and over. The institutional population is included in the denominator of the labor force participation rates and employment-population rates for Japan and Germany.

For most of the countries in table 47, the measures refer to total manufacturing as defined by the International Standard Industrial Classification. However, the measures for France (beginning 1959), Italy (beginning 1970), and the United Kingdom (beginning 1976) refer to manufacturing and mining less energy-related products. For all countries, manufacturing includes the activities of government enterprises.

In addition, for all countries, preliminary estimates for recent years are generally based on current indicators of manufacturing output, employment and hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

Additional sources of information

For further information, see *International Comparisons of Unemployment*, Bulletin 1979 (Bureau of Labor Statistics, 1978), Appendix B and Supplements to Appendix B. Additional detail is also found in the BLS *Handbook of Methods*, Bulletin 2134, Vol. 1, Chapter 16. Additional international comparison statistics are available in the *Handbook of Labor Statistics* (BLS Bulletin 2217, 1985). The most recent statistics are presented and analyzed annually in the *Monthly Labor Review*, typically in the December issue (for the previous year) and in February.

OCCUPATIONAL INJURY AND ILLNESS DATA

(Table 48)

Description of the series

The Annual Survey of Occupational Injuries and Illnesses is designed to collect data on injuries and illnesses based on records which employers in the following industries maintain under the Occupational Safety and Health Act of 1970: agriculture, forestry, and fishing; oil and gas extraction; construction; manufacturing; transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. Excluded from the survey are self-employed individuals, farmers with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies.

Because the survey is a Federal-State cooperative program and the data must meet the needs of participating State agencies, an independent sample is selected for each State. The sample is selected to represent all private industries in the States and territories. The sample size for the survey is dependent upon (1) the characteristics for which estimates are needed; (2) the industries for which estimates are desired; (3) the characteristics of the population being sampled; (4) the target reliability of the estimates; and (5) the survey design employed.

While there are many characteristics upon which the sample design could be based, the total recorded case incidence rate is used because it is one of the most important characteristics and the least variable; therefore, it requires the smallest sample size.

The survey is based on stratified random sampling with a Neyman allocation and a ratio estimator. The characteristics used to stratify the establishments are the Standard Industrial Classification (SIC) code and size of employment.

Definitions

Recordable occupational injuries and illnesses are: (1) occupational deaths, regardless of the time between injury and death, or the length of the illness; or (2) nonfatal occupational illnesses; or (3) nonfatal occupational injuries which involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment (other than first aid).

Occupational injury is any injury such as a cut, fracture, sprain, amputation, etc., which results from a work accident or from exposure involving a single incident in the work environment.

Occupational illness is an abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday cases are cases which involve days away from work, or days of restricted work activity, or both.

Lost workday cases involving restricted work activity are those cases which result in restricted work activity only.

Lost workdays away from work are the number of workdays (consecutive or not) on which the employee would have worked but could not

because of occupational injury or illness.

Lost workdays—restricted work activity are the number of workdays (consecutive or not) on which, because of injury or illness: (1) the employee was assigned to another job on a temporary basis; or (2) the employee worked at a permanent job less than full time; or (3) the employee worked at a permanently assigned job but could not perform all duties normally connected with it.

The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked even though able to work.

Incidence rates represent the number of injuries and/or illnesses or lost workdays per 100 full-time workers.

Notes on the data

Estimates are made for industries and employment-size classes and for severity classification: fatalities, lost workday cases, and nonfatal cases without lost workdays. Lost workday cases are separated into those where the employee would have worked but could not and those in which work activity was restricted. Estimates of the number of cases and the number of days lost are made for both categories.

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses, or lost workdays, per 100 full-time employees. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Only a few of the available measures are included in the *Handbook of Labor Statistics*. Full detail is presented in the annual bulletin, *Occupational Injuries and Illnesses in the United States, by Industry*.

Comparable data for individual States are available from the BLS Office of Occupational Safety and Health Statistics.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration, respectively. Data from these organizations are included in BLS and State publications. Federal employee experience is compiled and published by the Occupational Safety and Health Administration. Data on State and local government employees are collected by about half of the States and territories; these data are not compiled nationally.

Additional sources of information

The Supplementary Data System provides detailed information describing various factors associated with work-related injuries and illnesses. These data are obtained from information reported by *employers* to State workers' compensation agencies. The Work Injury Report program examines selected types of accidents through an employee survey which focuses on the circumstances surrounding the injury. These data are not included in the *Handbook of Labor Statistics* but are available from the BLS Office of Occupational Safety and Health Statistics.

The definitions of occupational injuries and illnesses and lost workdays are from *Recordkeeping Requirements under the Occupational Safety and Health Act of 1970*. For additional data, see *Occupational Injuries and Illnesses in the United States, by Industry*, annual Bureau of Labor Statistics bulletin; BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), ch. 17; *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985), pp. 411–14; annual reports in the *Monthly Labor Review*; and annual U.S. Department of Labor press releases.

1. Labor market indicators

Selected indicators	1983	1984	1983	1984				1985

---

[1] Cost (cents-per-hour worked) measured in the Employment Cost Index consists of wages, salaries and employer cost of employee benefits.

[2] Consist of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.

[3] Consists of legislative, judicial, administrative, and regulatory activities.

[4] Includes, for example, library, social, and health services.

[1] The indexes are calculated differently from those for the occupation and industry groups. For a detailed description of the index calculation, see the Monthly Labor Review Technical Note, "Estimation procedures for the Employment Cost Index," May 1982.

25. Specified compensation and wage adjustments from contract settlements, and effective wage adjustments, private industry collective bargaining situations covering 1,000 workers or more (in percent)

Measure	Annual average		Quarterly average							
	1983	1984	1983	1984				1985		
			IV	I	II	III	IV	I^{p}	II^{p}	III^{p}
Specified adjustments:										
Total compensation[1] adjustments,[2] settlements covering 5,000 workers or more:										
First year of contract	3.4	3.6	4.0	5.1	3.5	2.7	3.7	4.4	3.5	1.7
Annual rate over life of contract	3.0	2.8	3.1	4.7	3.2	3.1	2.0	4.0	3.5	2.9
Wage adjustments, settlements covering 1,000 workers or more:										
First year of contract	2.6	2.4	4.2	2.8	2.6	2.1	2.3	3.4	2.5	1.7
Annual rate over life of contract	2.8	2.4	2.8	3.3	2.7	2.6	1.5	3.2	2.9	2.9
Effective adjustments:										
Total effective wage adjustment[3]	4.0	3.7	1.1	.9	.9	1.2	.7	.7	.8	1.2
From settlements reached in period	.8	.8	.6	.1	.1	.2	.3	.1	.2	.2
Deferred from settlements reached in earlier periods	2.5	2.0	.3	.4	.7	.7	.2	.6	.5	.6
From cost-of-living-adjustments clauses	.6	.9	.2	.3	.2	.3	.2	.1	.1	.4

[1] Compensation includes wages, salaries, and employers' cost of employee benefits when contract is negotiated.

[2] Adjustments are the net result of increases, decreases and no changes in compensation or wages.

[3] Because of rounding total may not equal sum of parts.

^{p} = preliminary.

26. Average specified compensation and wage adjustments, major collective bargaining settlements in private industry situations covering 1,000 workers or more during 4-quarter periods (in percent)

Measure	Average for four quarters ending–							
	1983	1984				1985		
	IV	I	II	III	IV	I^p	II^p	III^p
Specified total compensation adjustments, settlements covering 5,000 workers or more, all industries:								
First year of contract	3.4	4.8	4.7	4.2	3.6	3.4	3.5	3.1
Annual rate over life of contract	3.0	3.6	3.5	3.2	2.8	2.7	2.8	2.8
Specified wage adjustments, settlements covering 1,000 workers or more:								
All industries

Contracts without COLA clauses	2.6	2.2	1.8	1.4	1.0	1.4	1.7	(¹)

[1] Data do not meet publication standards.

^p = preliminary.

27. Average effective wage adjustments, private industry collective bargaining situations covering 1,000 workers or more during 4-quarter periods (in percent)

Effective wage adjustment	Average for four quarters ending–						
	1984				1985		
	I	II	III	IV	I^p	II^p	III^p
For all workers:¹							
Total	4.7	4.3	4.2	3.7	3.6	3.5	3.4
From settlements reached in period	1.2	1.0	1.0	.8	.7	.9	.8
Deferred from settlements reached in earlier period	2.5	2.2	2.1	2.0	2.2	1.9	1.8
From cost-of-living-adjustments clauses	1.0	1.1	1.2	.9	.7	.7	.8
For workers receiving changes:							
Total	5.5	5.3	5.0	4.4	4.5	4.2	4.3
From settlements reached in period	4.2	3.6	3.7	3.0	2.9	2.9	2.8
Deferred from settlements reached in earlier period	5.5	4.9	4.2	4.0	4.2	3.9	3.7
From cost-of-living-adjustments clauses	3.8	4.0	3.2	2.7	2.3	2.3	2.8

[1] Because of rounding total may not equal sum of parts.

^p = preliminary.

28. Specified compensation and wage adjustments from contract settlements, and effective wage adjustments, State and local government collective bargaining situations covering 1,000 workers or more (in percent)

Measure	Annual average		First 6 months 1985p
	1983	1984	
Specified adjustments:			
Total compensation [1] adjustments, [2] settlements covering 5,000 workers or more:			
First year of contract	4.6	5.2	4.7
Annual rate over life of contract	5.2	5.4	4.9
Wage adjustments, settlements covering 1,000 workers or more:			
First year of contract	–	4.8	4.9
Annual rate over life of contract	–	5.1	5.1
Effective adjustments:			
Total effective wage adjustment [3]	–	5.0	1.6
From settlements reached in period	–	1.9	.9
Deferred from settlements reached in earlier periods	–	3.1	.6
From cost-of-living-adjustment clauses	–	.0	.0

[1] Compensation includes wages, salaries, and employers' cost of employee benefits when contract is negotiated.

[2] Adjustments are the net result of increases, decreases and no changes in compensation or wages.

[3] Because of rounding total may not equal sum of parts.

– Data not available.

p = preliminary.

29. Work stoppages involving 1,000 workers or more

Measure	Annual totals		1984	1985											
	1984	1985	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July^p	Aug.^p	Sept.^p	Oct.^p	Nov.^p	Dec.^p
Number of stoppages:															
Beginning in period	62	–	3	2	4	4	3	2	2	9	6	11	4	2	2
In effect during period	68	–	13	9	13	12	8	8	8	13	18	20	18	11	8
Workers involved:															
Beginning in period (in thousands)	376.0	–	42.5	4.7	29.3	15.2	6.2	6.9	15.7	52.3	15.3	66.5	74.8	25.0	9.2
In effect during period (in thousands)	391.0	–	58.0	16.0	43.9	48.2	14.1	14.8	28.5	60.2	66.6	93.8	117.3	64.8	38.1
Days idle:															
Number (in thousands)	8,496.0	–	655.8	278.3	259.3	698.5	229.5	203.3	454.3	500.2	889.7	931.4	1,430.0	651.2	665.4
Percent of estimated working time [1]	.04	–	.04	.01	.01	.03	.01	.01	.02	.02	.03	.04	.06	.03	.03

[1] Agricultural and government employees are included in the total employed and total working time: private household, forestry, and fishery employees are excluded. An explanation of the measurement of idleness as a percentage of the total time worked is found in "'Total Economy' Measure of Strike Idleness," Monthly Labor Review, October 1968, pp. 54-58.

– Data not available.

p = preliminary.

30. Consumer Price Index for All Urban Consumers: U.S. city average, by expenditure category and commodity service group; and CPI for urban wage earners and clerical workers, All items

(1967=100, unless otherwise indicated)

[1] Area is generally the Standard Metropolitan Statistical Area (SMSA), exclusive of farms. L.A.-Long Beach, Anaheim, Calif. is a combination of two SMSA's, and N.Y., N.Y.-Northeastern N.J. and Chicago, Ill.-Northwestern Ind. are the more extensive Standard Consolidated Areas. Area definitions are those established by the Office of Management and Budget in 1973, except for Denver-Boulder, Colo. which does not include Douglas County. Definitions do not include revisions made since 1973.

[2] Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

M - Every month.

1 - January, March, May, July, September, and November.

2 - February, April, June, August, October, and December.

[3] Regions are defined as the four Census regions.

The population size classes are aggregations of areas which have urban population as defined:

A-1 - More than 4,000,000.

A-2 - 1,250,000 to 4,000,000.

B - 385,000 to 1,250,000

C - 75,000 to 385,000.

D - Less than 75,000.

Population size class A is the aggregation of population size classes A-1 and A-2.

- Data not available.

NOTE: Local area CPI indexes are by-products of the national CPI program. Because each local index is a small subset of the national index, it has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error than the national index. As a result, local area indexes show greater volatility than the national index, although their long-term trends are quite similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in escalator clauses.

[1] Quarterly rates are for the first month of the quarter.

[2] Major changes in the Italian labor force survey, introduced in 1977, resulted in a large increase in persons enumerated as unemployed. However, many persons reported that they had not actively sought work in the past 30 days, and they have been provisionally excluded for comparability with U.S. concepts. Inclusion of such persons would more than double the Italian unemployment rate shown.

- Data not available.

NOTE: Quarterly and monthly figures for France, Germany, and Great Britain are calculated by applying annual adjustment factors to current published data and therefore should be viewed as less precise indicators of unemployment under U.S. concepts than the annual figures.

46. Annual data: Employment status of the civilian working-age population, ten countries

---

[1] Total cases include fatalities.

[2] The incidence rates represent the number of injuries and illnesses or lost workdays per 100 full-time workers and were calculated as:
(N/EH) X 200,000, where:
N = number of injuries and illnesses or lost workdays.
EH = total hours worked by all employees during calendar year.
200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year.)

[3] Excludes farms with fewer than 11 employees since 1976.

SALES PUBLICATIONS

BLS Bulletins

Supplement to Employment, Hours, and Earnings, States and Areas, Data for 1980-84. Bulletin 1370-19, 392 pp., $14 (GPO Stock No. 029-001-02859-8). The 20th reference volume grouping together establishment data on employment, hours, and earnings for States and areas. The data supersede those published for recent years in Bulletin 1370-18. Employment data relate to the nonfarm sector of the economy and exclude the Armed Forces, proprietors, the self-employed, domestic workers, and unpaid family workers. Hours and earnings for manufacturing and mining relate to production workers; for construction, to construction workers; and for the remaining nonagricultural components, to nonsupervisory workers.

Area Wage Surveys

These bulletins cover office, professional, technical, maintenance, custodial, and material movement jobs in major metropolitan areas. The annual series of 70 is available by subscription for $102 per year. Individual area bulletins are also available separately.

Baltimore, Maryland, Metropolitan Area, August 1985. Bulletin 3030-35, 41 pp., $1.75 (GPO Stock No. 829-001-00035-7).

MONTHLY LABOR REVIEW

MARCH 1986
VOLUME 109, NUMBER 3

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

A SPECIAL SECTION ON PRODUCTIVITY

Edwin Dean and others 3 **Productivity and labor cost trends in manufacturing, 12 countries**
Output per hour in manufacturing increased in the U.S and 11 other nations in 1984; U.S. unit labor costs also rose relative to foreign costs on a dollar-adjusted basis

Arthur S. Herman 11 **Productivity continued to increase in many industries during 1984**
Among industries with large increases in output per employee hour were steel, coal and iron mining, transportation, and utilities; changes were mixed in trade and services

Leo Sveikauskas 16 **The contribution of R&D to productivity growth**
A BLS study suggests that R&D directly contributed between 0.1 and 0.2 percent annually to the postwar growth of productivity in the nonfarm business sector

Horst Brand, Ziaul Z. Ahmed 21 **Beauty and barber shops: the trend of labor productivity**
Output per hour rose at an annual rate of 0.8 percent between 1972 and 1984, in line with the productivity trend for other personal service industries

E. S. Persigehl, J. G. Olsen 27 **Productivity in the metal doors, sash, and trim industry**
The overall rate of output per hour increased slowly between 1967 and 1983, reflecting a rise in employee hours; moderate advancement is expected to continue

Labor Month In Review

IMMIGRATION EFFECTS. In its report for 1986, the President's Council of Economic Advisers, drawing on various studies, reported on the impact of immigration on the labor market. Here are excerpts:

No displacement. Studies that take a broad view of the labor market have found no significant evidence of unemployment among native-born workers attributable to immigration. Any direct effects of immigration on domestic employment have either been too small to measure or have been quickly dissipated.

Although existing studies may not be conclusive, the evidence currently available does not suggest that native-born American workers experience significant labor market difficulties in areas that have attracted immigrants. Several studies, moreover, have shown that the presence of immigrants in labor markets is associated with increased job opportunities overall, including job opportunities for native-born minority groups.

Some studies of the effects of immigration on wage levels have revealed evidence of adverse wage effects. For example, one study concluded that real wages were 8 to 10 percent lower on average in cities near the Mexican border. Several studies found a reduction in the wages of unskilled workers in areas with high concentrations of unskilled immigrant workers.

Other studies, however, have shown that greater concentrations of aliens in labor markets are associated with higher earnings of native-born workers. Increased wages have been found both for broad groups of workers and also for native-born minority groups with whom immigrants might compete directly for jobs.

The experience of the Los Angeles labor market in adjusting to a growing concentration of unskilled immigrant labor is instructive. One study estimated that more than a million foreign-born persons settled in Los Angeles County between 1970 and 1983. During the early 1980's, the foreign-born in Los Angeles County represented close to a third of the total population. Job growth in the area was strong, and the new immigrants were quickly absorbed into the labor market. New immigrant workers accounted for some 70 percent of the new growth in employment in the 1970s. This study also showed that the unemployment rate in Los Angeles, which had exceeded the national average in 1970, fell below the average by the early 1980s. These results were not, of course, the consequence of international migration alone, but they suggest a smooth labor market adjustment to the inflow of migrants.

Illegal aliens. Although aliens who are eligible to hold jobs in the United States are clearly distinct from those who are not, researchers have not been able to isolate separate economic effects of illegal alien workers.

Illegal aliens have a higher proportion of males than legal aliens, are younger, and are less likely to bring family members with them. Illegal migrants are likely to remain in the United States for shorter periods of time than legal migrants. Illegal migrants also tend to have lower levels of education and to work in jobs requiring lower skill levels. Illegal aliens may have less incentive to invest in schooling or other activities that are specifically useful in the U.S. labor market.

Nevertheless, a recent study of apprehended illegal aliens in Chicago showed that they use market opportunities to improve their economic status. The subjects of the study were able to benefit from a competitive labor market, with opportunities for skill improvement and upward job mobility. These illegal aliens were apparently able to work their way up from entry-level jobs. Only 16 percent of those in the Chicago study had wage rates below the Federal minimum of $3.35 per hour, and some of these were in sectors not covered by the minimum wage. The average hourly wage of these illegal aliens at the time of their apprehension, in 1983, was $4.50.

Entrepreneurs. Many immigrants are entrepreneurs. One study found that foreign-born males are significantly more likely to be self-employed than native-born males with similar skills. Self-employed workers, both foreign- and native-born, had higher annual incomes than salaried workers. Returns on capital owned by self-employed workers may partially explain these differences in incomes. Self-employment also provides greater potential for high work effort. The self-employed work more hours per week than do wage-and-salary workers.

One reason for the successful absorption of immigrants into the U.S. labor market is that overall migrant inflows have been low relative to the size of the population, to labor force growth, and to domestic migration. International migrant flows, moreover, historically respond to labor market demands. Before legal restrictions were imposed, immigration increased when the demand for labor was relatively high and decreased when labor demand was relatively low.

The full report of the Council of Economic Advisers appears in the *Economic Report of the President*, available from the Superintendent of Documents, Washington 20402. Price: $8.50.

Productivity and labor costs trends in manufacturing, 12 countries

Output and output per hour in manufacturing rose in the United States and 11 other countries in 1984; U.S. unit labor costs increased 7 percent, relative to the costs of foreign competitors, after adjustment for the dollar's appreciation

EDWIN DEAN, HARRY BOISSEVAIN,
AND JAMES THOMAS

Manufacturing productivity, as measured by output per hour, rose in 1984 in the United States and 11 other industrial countries studied. The United States had a substantial increase of 5 percent, but this was exceeded by five of the other countries—Japan, France, Italy, the Netherlands, and Sweden. Belgium, West Germany,[1] and the United Kingdom about matched the U.S. gain; Canada, Denmark, and Norway had smaller increases.

Manufacturing output grew in all 12 countries in 1984, for the first time since 1973. The U.S. and Japanese output growth rates of more than 11 percent were the largest, and the French increase of 2 percent was the lowest. Productivity rose in the United States, Canada, Japan, Denmark, Norway and Sweden because output rose at a greater rate than hours.[2] The productivity increases for the other countries resulted from a combination of output gains coupled with decreased hours.

Unit labor costs, which reflect changes in productivity and hourly compensation, fell in the United States, Canada, Japan, Germany, and the Netherlands; and rose in the other European countries. However, unit labor costs measured in U.S. dollars were again significantly influenced by changes in currency exchange rates, as they have been since 1980. The dollar remained stable with the Japanese yen, but appreciated 5 percent against the Canadian dollar and 7 to 14 percent against the European currencies. Consequently, unit labor costs fell in each of the 11 foreign countries when measured in U.S. dollars, with the falloffs ranging from 3 to 15 percent—compared with a 1-percent decline in the United States.

Since 1980, U.S. manufacturing unit labor costs have risen at a 7-percent average annual rate relative to a trade-weighted average for the 11 rival industrial countries, re-

---

Edwin Dean, formerly an economist in the Division of Foreign Labor Statistics, Bureau of Labor Statistics, is now chief of the Bureau's Division of Productivity Research. Harry Boissevain and James Thomas are economists in the Division of Foreign Labor Statistics.

versing the gains in comparative unit labor costs that U.S. manufacturers experienced during most of the 1970's. All of the 1980–84 relative increase, however, resulted from the appreciation of the U.S. dollar. Measured on a national currency basis, U.S. unit labor costs decreased at a 1-percent average annual rate relative to the trade-weighted average for the other 11 countries. Along with the rapid rise in U.S. relative unit labor costs in this period, the U.S. merchandise trade deficit increased fourfold.

This article examines 1984 developments in manufacturing labor productivity, hourly compensation, and unit labor costs in the United States and 11 countries, and compares unit labor cost trends measured in U.S. dollars prior to 1980 with the trends of the last 4 years. The indexes for 1984 are preliminary, while those for other recent years reflect some revised underlying statistics for most countries.[3]

The U.S. figures reflect the recent comprehensive benchmark revision of the U.S. national accounts, including the shift in the base period for the calculation of constant dollar estimates from 1972 to 1982. The effect is to reduce U.S. manufacturing output growth, and productivity, by about two-tenths of a percentage point in the pre-1973 period, but to have virtually no overall effect on the post-1973 period. Japan also rebenchmarked its national accounts, from 1975 to 1980, resulting in about a 1.5-percentage point reduction in output and productivity growth rates since 1973. In addition, a new average hours series has been introduced for Germany,[4] as well as new output series for the Netherlands[5] and the United Kingdom[6] since the previous *Monthly Labor Review* article in 1984.[7] The new series for Germany affects the year-to-year movements in output per hour and hourly compensation, but has no effect on the unit labor cost measures.

Productivity trends

As noted earlier, 1984 manufacturing productivity[8] increased for all the countries studied. (See table 1.) The Netherlands had the largest gain—more than 10 percent—followed by Japan, France, Italy, and Sweden, with gains of about 6 to 7 percent. Output per hour rose about 5 percent in the United States, Belgium, Germany, and the United Kingdom, and 1 to 4 percent in Canada, Denmark, and Norway.

Productivity researchers have found that a marked slowdown in manufacturing productivity growth occurred in most developed countries beginning about 1973. All 12 countries studied here had slower productivity gains in the 1973–84 period than in the 1960–73 period.

Another study reports that this slowdown in total manufacturing productivity was reflected in specific manufacturing industries in the United States, France, Germany, and the United Kingdom—after 1973, productivity growth declined in each of 13 manufacturing industry groups, in these four countries, with only one exception.[9]

For all but three of the 12 countries—Belgium, Denmark, and Norway—the 1984 increases in total manufacturing productivity were much larger than the average trend for the 1973–84 period. Moreover, the United States, the Netherlands, and the United Kingdom had 1984 gains that exceeded their average rates of increase over the 1960–73 period.

Output. In all 12 countries, output gains influenced the 1984 productivity increases. (See table 2.) Output (gross product originating in manufacturing at constant prices) rose most rapidly in the three non-European countries, with growth between 8 and 12 percent. The percentage increases were the largest since 1973 for Canada and Japan, and since the 1950's for the United States.

The European countries output increases exceeded their performance of the previous year. Denmark, the Netherlands, and Sweden had strong gains of between 5 and 7 percent; Germany, Italy, and the United Kingdom grew by 4 percent; and Belgium, France, and Norway had more modest expansions of less than 3 percent. Output gains were the largest since 1976 for the Netherlands, and since 1973 or 1974 for Norway, Sweden, and the United Kingdom. Although the British output increase was larger than in recent years, the level of output was still 12 percent below that of 1973. Canada, Italy, and Norway were the only other

countries in which manufacturing output had not yet recovered to previous peak levels.

Employment and hours

In the three non-European countries and Denmark, total hours of input in manufacturing rose between 4 and 7 percent in 1984, with the United States recording the largest gain. (See table 3.) Total hours rose modestly in Norway and Sweden and fell in the remaining 6 countries; except for France, the declines in total hours were smaller than in the previous year.

All of the European countries have experienced long-term declines in aggregate hours over the 1973–84 period, ranging from an annual average rate of about 1.5 percent in Denmark and Italy to around 4 percent in Belgium and the United Kingdom. In Japan, Canada, and the United States, there has been little overall change in total hours over the 1973–84 period.

The 1984 expansions in aggregate hours in the United States and Japan were the result of substantial increases in employment and small percentage increases in average hours. In Canada, a large increase in employment was accompanied by a slight drop in average hours. The 1984 employment increases in the United States, Canada, and Japan were the largest since 1973. Nonetheless, the levels of manufacturing employment in the United States and Canada in 1984 were between 5 and 8 percent below the peaks of the late 1970's, while in Japan, 1984 was about 1 percent below the previous peak reached in 1974.

Among the European countries, Belgium, Germany, the Netherlands, the United Kingdom, and the three Scandinavian countries all recorded either a rise or a lower rate of decrease in 1984 employment, compared with 1983. These countries also had higher rates of employment growth or smaller rates of decline in 1984 than they experienced, on average, during the 1973–84 period. In contrast, employment in France and Italy declined at a more rapid rate in 1984 than the average for the 1973–84 period.

The long-term trend in manufacturing employment has been downward in the European countries. Most countries had employment peaks in the 1960's or 1970's that were more than 15 percent above 1984 levels. The contrast, in this respect, to the three non-European countries is marked, and essentially unaltered by the favorable employment developments in 1984 in seven of the nine European countries.

In most of the European countries, the 1984 changes in aggregate hours took place mainly as a result of changes in employment rather than in average hours per employee. Changes in average hours had substantial effects on aggregate hours only in Belgium and the Netherlands, where average hours declined by 2 to 3 percent.

The declines in Belgium and the Netherlands occurred as employers, unions, and government took measures, beginning in 1982 and continuing through 1984, to reduce average hours worked, hoping that this would retard the rapid rate of decline in employment. A key element in these efforts has been a reduction in average hours through reorganization of work time negotiated at the company, industry, and sectoral levels. The negotiations in both countries produced a variety of reorganization schemes, but the most common provided for reduced annual hours by granting additional days of vacation or free shifts. The Netherlands Central Bureau of Statistics reported that by the end of 1984, hours reductions had affected 63 percent of firms and 86 percent of employees in Dutch manufacturing. In both countries—despite the concerted efforts of government and collective bargaining agents—employment continued to fall in 1984, but the rate of decline was substantially less than in the preceeding 2 years.[10]

Over the 1973–84 period, average hours per employee declined in nine of the countries studied. In the remaining three countries—the United States, Japan, and Denmark—average hours were essentially unchanged. Only two countries, Belgium and the Netherlands, had 1984 reductions in average hours that exceeded the long-term trend.

Hourly compensation

For all countries, hourly compensation costs—which include wages and salaries, supplements, and employer payments for social security and other employee benefit programs—rose at a lower rate in 1984 than the average for the years since 1973. (See table 4.) Canada had the lowest rise, less than 2 percent, followed by Japan, the United States, and Germany, each with less than 4 percent increases. Belgium, Denmark, France, the Netherlands, Norway, and the United Kingdom recorded increases of 5 to 9 percent. Italy and Sweden had the highest rates, about 10 to 11 percent.

The Netherlands and Sweden were the only countries to show a markedly more rapid rise in hourly compensation in 1984 than in 1983. For Sweden, 1984 was the second consecutive year of progressively larger increases. In Denmark, the 1984 compensation increase was the lowest since the 1950's, which may be attributed, in part, to the fact that in late 1982 the government imposed a 2-year freeze on pay indexation and restricted local-level collective bargaining.[11]

Unit labor costs

Productivity increases in 1984 more than offset the rises in hourly compensation costs in the United States, Canada, Japan, Germany, and the Netherlands; consequently, unit labor costs fell 1 to 4 percent. This marked the third consecutive year in which unit labor costs fell in Japan and the second consecutive year of declines for the United States, Germany, and the Netherlands. Unit labor costs rose between 2 and 5 percent in the other countries. Italy had one of the largest increases (4 percent), but this represented a sharp deceleration from Italy's 1983 increase (14 percent).

As noted earlier, the 1984 increases in hourly compensation were below the 1973–84 trend rates in all 12 countries, and the 1984 increases in output per hour were well above the 1973–84 trend in 9 countries. Therefore, it is not surprising that the 1984 performance in unit labor costs was favorable, compared to 1973–84 trends, because unit labor costs represent the ratio of hourly compensation to output per hour.

In U.S. dollars. Because labor costs are a principal component of the costs of manufactured goods, unit labor costs play a major role in conjunction with the exchange rates among currencies in determining the relative prices of goods offered for sale on the world market.

During 1984, changes in currency exchange rates had a significant effect on relative changes in unit labor costs measured in U.S. dollars. The U.S. dollar appreciated relative to the currencies of 10 of the countries studied and remained unchanged relative to the Japanese yen. In each year of the 1980–84 period, the dollar appreciated strongly relative to each of the European countries' currencies. It appreciated much more moderately relative to the Canadian dollar in 3 of the years. The dollar rose relative to the yen only in 1982. However, as of 1984, the yen had not regained its 1980 currency exchange value.

In 1984, unit labor costs measured in U.S. dollars fell in the 11 foreign countries. The decreases were 15 percent for the Netherlands; 10 to 11 percent for Belgium, France, Germany, Italy, and the United Kingdom; 6 to 8 percent for Canada, Denmark, and Norway; and less than 4 percent for Japan and Sweden. The 1984 changes were more damaging

[1] A trade-weighted average of the 11 foreign countries. See description of weights in text.

NOTE: Rates of change computed from the least squares trend of the logarithms of the index numbers. Index numbers for the underlying data series are available from the authors.

to the competitive position of the United States than the shifts of the previous year. In 1983, when U.S. unit labor costs decreased by about 3 percent, they decreased by larger proportions in eight countries, but increased in three countries, including Canada and Japan, two of the most important trading partners of the United States.

The appreciation of the dollar after 1980 has had a dramatic effect on U.S. unit labor costs relative to other countries. The following tabulation shows the average annual percentage change between 1980 and 1984 in unit labor costs measured in national currencies and in U.S. dollars:

	National currency	*U.S. dollars*
United States	2.1	2.1
Canada	6.4	3.9
Japan	−1.0	−2.7
Italy	14.0	−4.1
Norway	6.7	−5.8
Denmark	6.5	−8.1
Germany	1.7	−8.2
France	8.3	−9.5
Netherlands	.6	−9.9
United Kingdom	3.3	−10.2
Sweden	4.5	−12.3
Belgium	1.6	−14.2

Expressed in national currencies, seven countries had greater increases in unit labor costs than the United States. Taking into account the appreciation of the dollar after 1980, only one country, Canada, experienced a greater increase.

Relative productivity and labor cost trends

Following is a discussion of changes in the trends of each country's manufacturing productivity and labor costs relative to a trade-weighted average for its major international competitors.[12] The indexes were constructed by taking ratios of each country's indexes to weighted geometric averages of the corresponding indexes for the other 11 countries. The weights used to combine the other 11 countries' indexes into an average "competitors" index reflect the relative importance of each country as a manufacturing trade competitor as of 1980. Prior to this article, 1975 trade weights were used. The most significant change affecting U.S. "competitors" indexes was an increase in the relative weight given to Japan, from 17 to more than 27 percent. The weights for Canada and the United Kingdom rose about 1 percent each; the weights for all other countries fell.

Annual percent changes in the ratio of each country's productivity and labor cost indexes to the trade-weighted averages of the 11 rival nations' indexes were calculated for 1960 to 1984. (See table 5.) These percent changes indicate the annual movements in each country's productivity and labor costs relative to its competitors' productivity and costs.

Relative productivity changes. The United States has experienced a long-term relative decline in productivity, compared with the trade-weighted average of the other countries—amounting to 4.0 percent per year in the 1960–73 period and 1.7 percent per year in the 1973–84 period. Norway and the United Kingdom were the only other countries to experience significant relative declines. Japan had by far the most rapid increases in relative productivity growth in both periods—6.0 percent in the 1960–73 period and 3 percent per year since 1973—followed by the Netherlands in the earlier period (1.5 percent) and by Belgium in the latter (2.5 percent). The relatively poor performance of the U.S. manufacturing sector reflects, in part, a "catching-up" by other countries.

While the United States has had a long-term relative decline in productivity, U.S. productivity growth since 1981 has equalled the trade-weighted average of the 11 foreign countries. This reflects the large U.S. productivity increase of 1983 followed by the further substantial increase of 1984.

Relative compensation. The largest 1984 relative increases in manufacturing hourly compensation, relative to changes in competitor countries, took place in France, Italy, and Sweden. The largest relative decreases were in the three non-European countries and Germany. In the years since 1973, the largest decreases occurred in Germany, at an annual rate of more than 3 percent, and in the United States, Japan and the Netherlands, at 2- to 3-percent annual rates. Italy (at 8 percent), the United Kingdom (at 5 percent), and France (at 3 percent) recorded the largest increases.

Relative unit labor costs. In 1984, the largest increases in relative unit labor costs, measured in national currencies, were recorded by Denmark, France, Italy, Norway, Sweden, and the United Kingdom. The largest relative decreases were in Japan and the Netherlands. The United States, with a relative decrease of 0.4 percent, occupied an intermediate position. The 1984 decrease in relative U.S. unit labor costs, matched the trend for the period since 1973.

After adjustment for relative changes in foreign exchange rates, U.S. unit labor costs rose 7 percent in 1984 relative to competitors, far exceeding the 0.4-percent rise of the previous year. The 1984 U.S. increase also far exceeded the increases recorded by Japan and the three Scandinavian countries, the only other countries to have increases in relative unit labor costs in U.S. dollars. The Netherlands and

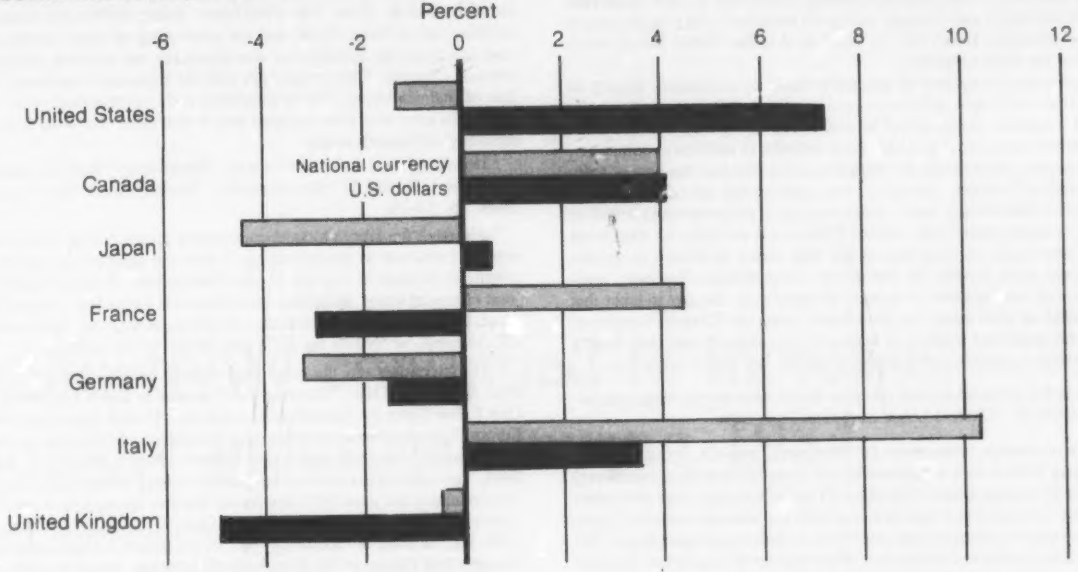
NOTE: Rates of change computed from the least squares trend of the logarithms of a ratio of 2 index numbers. The ratio is the index of the reference country divided by a trade-weighted average index for the other 11 countries.

Chart 1. Average annual percentage changes in relative unit labor costs in manufacturing, seven countries, 1980-84



NOTE: Average annual percentages changes are computed from the least squares trend of the logarithms of a ratio of two index numbers. The ratio is the index of the reference country divided by a trade-weighted average index for the other 11 countries.

Canada recorded the largest decreases in relative unit labor costs in U.S. dollars, at 7 and 4 percent.

During the 1980–84 period of rapid appreciation of the U.S. dollar relative to most foreign currencies, the United States experienced a 1-percent per year decrease in relative unit labor costs in national currency terms, but a 7-percent per year increase after adjustment for the relative change in the foreign exchange value of the dollar.

Chart 1 shows the effect of adjusting relative unit labor cost changes for relative changes in foreign exchange rates over the 1980–84 period for the seven largest countries (United States, Canada, Japan, France, Germany, Italy, and the United Kingdom). Japan was the only country other than the United States to experience a much larger increase in relative unit labor costs after adjustment for changes in the exchange rate—a 4-percent per year decrease in relative unit costs before adjustment and a 1-percent per year increase after. Japan and the United States were the only two countries to record large average annual appreciations of their currencies relative to trade-weighted averages of the currencies of their competitors. (Canada, Germany, and the Netherlands registered small increases.) The relative appreciations were 9 percent for the United States and 5 percent for Japan.

The difference between the United States' annual average increase of 7 percent in relative unit labor costs in U.S. dollars and the 1-percent increase for Japan was due partly to the greater currency appreciation experienced by the United States over the 1980–84 period. It was also due partly to the greater decrease in relative unit labor costs in national currency recorded for Japan, about 4 percent annually, compared with 1 percent for the United States. The average Japanese decrease of about 4 percent per year in relative unit labor costs in national currency units was due to a 1.4-percent increase in productivity and a 3-percent decrease in hourly compensation. The U.S. decrease of 1 percent per year in relative unit labor costs was the net result of a 1.5-percent decrease in compensation and a small decrease in relative productivity.

The effect of relative exchange rate changes on relative U.S. unit labor costs in 1980–84 contrasts sharply with the U.S. experience in 1973–80. In the earlier period, a gradual relative depreciation of the dollar converted a 1-percent average annual decline in relative unit labor costs, in national currency units, into an average annual decrease of 2.5 percent.

As the dollar appreciated from 1980 to 1984, the U.S. merchandise trade deficit steadily increased, from $25 billion in 1980 to $36 billion in 1982 and $108 billion in 1984. This deficit is computed for all U.S. trading partners, not just the 11 partners examined in this study. ☐

FOOTNOTES

[1] The Federal Republic, including West Berlin.

[2] The data relate to all employed persons, including the self-employed, in the United States and Canada, and to all wage and salary employees in the other countries. Hours refer to hours paid in the United States; hours worked in the other countries.

Compensation comprises all payments made by employers directly to their employees (before deductions) and employer contributions to legally required insurance programs and to contractual and private welfare plans for the benefit of employees. Labor costs include, in addition to compensation, employer expenditures for recruitment and training; the cost of cafeterias, medical facilities, and other plant facilities and services; and taxes (other than social security taxes, which are part of compensation) levied on payrolls or employment rolls. Annual data are not available for total labor costs. Labor costs, as measured in the data series used for this article, approximate more closely the concept of compensation. However, compensation has been adjusted to include all significant changes in taxes that are regarded as labor costs. For the United States and Canada, compensation of self-employed workers is measured by assuming that their hourly compensation is equal to the average for wage and salary employees.

[3] This article includes revised statistics which have not yet been incorporated in table 47, "Current Labor Statistics," this issue.

[4] The new average hours series for Germany, 1960–83, is computed by the German Institut fuer Arbeitsmarkt-und Berufsforschung (Nuremberg) and refers to average hours worked by all manufacturing wage and salary employees. It is consistent with and used with the national accounts figures on the number of manufacturing employees to derive aggregate hours. The previous hours series was the product of the number of employees, from the national accounts, and average annual hours per wage worker only, from a monthly industrial survey conducted by the German Federal Statistical Office. The industrial survey data were used for the preliminary 1984 figure.

[5] The new output series for the years beginning with 1969 is value added from the Netherlands national accounts. The figures include petroleum refining from 1977, but exclude petroleum refining over the 1969–77 period. The series previously used for these years was the index of industrial production for manufacturing prepared by the Central Bureau of Statistics. This measure was used because the previous national accounts figures for manufacturing included natural gas and petroleum extraction.

[6] The new output series for the United Kingdom, for the years beginning with 1976, is the index of output in manufacturing at constant factor cost, with separate manufacturing industries combined using weights proportional to the distribution of net output in 1980, that is published with the national accounts. The series previously used for these years was the 1975-based index of manufacturing production; this series is still used for the years before 1976. The 1980-based series, unlike the earlier one, excludes the refining of oil and the processing of other energy-related materials from the definition of manufacturing and includes extraction of non-fuel minerals. This corresponds with the European Community definition of manufacturing. The employment and compensation series beginning 1976 have also been replaced with series consistent with this revised definition of manufacturing.

[7] Donato Alvarez and Brian Cooper, "Productivity trends in manufacturing in the U.S. and 11 other countries," *Monthly Labor Review*, January 1984, pp. 52–58.

[8] Although the labor productivity measure relates output to the hours of persons employed in manufacturing, it does not measure the specific contributions of labor as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology, capital investment, the level of output, capacity utilization, energy use, and managerial effectiveness, as well as the skills and efforts of the work force.

[9] The exception was the paper and printing industry in France. Arthur Neef and Edwin Dean, "Comparative Changes in Labor Productivity and Unit Labor Costs by Manufacturing Industry: United States and Western Europe," presented at a conference on Interindustry Differences in Productivity Growth, American Enterprise Institute, Washington, D.C., October 1984. This paper also examines the possible role of industry-specific events in determining the post-1973 slowdown. See also Irving Kravis and Robert Lipsey, "The Diffusion of Economic Growth in the World Economy, 1950–80," in John W. Kendrick, ed., *International Comparisons of Productivity and Causes of the Slowdown* (Cambridge, MA, Ballinger, 1984).

[11] Incomes Data Services Ltd., *IDS International Report* (London), October 1984.

[12] The trade weights were adapted from weights developed by the International Monetary Fund (IMF). The original IMF weights cover 17 countries; the 11 foreign countries covered by this article account for 94 percent of the U.S. competitors' total trade weight. For more information about the relative indexes of manufacturing productivity and costs, see Patricia Capdevielle, Donato Alvarez, and Brian Cooper, "International trends in productivity and labor costs," *Monthly Labor Review*, December 1982, pp. 3–14. The weights are available from the authors, as are the relative indexes for each country and the underlying "own country" and "competitor countries" indexes used to compute the relative indexes. Indexes of trade-weighted exchange rates are also available from the authors.

Publications Awards

The *Monthly Labor Review* was one of five Bureau of Labor Statistics publications honored in the annual competition sponsored by the Washington chapter of the Society for Technical Communication. The competition was open to publications produced in 1985 by trade associations, private research and educational institutions, corporations, and government agencies. Contest criteria included audience definition, writing, editing, and graphics.

In addition to the *Review*, BLS publications honored were *The First Hundred Years of the Bureau of Labor Statistics*, *Trends in Manufacturing: A Chartbook*, *New from BLS*, and the *Occupational Outlook Quarterly*.

Productivity continued to increase in many industries during 1984

Among industries with large increases in output per employee hour were steel, coal and iron mining, and several transportation and utilities industries; changes were mixed in trade and service

ARTHUR S. HERMAN

Productivity, as measured by output per employee hour, grew in 1984 in about three quarters of the industries for which the Bureau of Labor Statistics regularly publishes data. Productivity increases were large in many industries. In a significant number, these gains followed major productivity growth in 1983. The expansion in industry productivity is consistent with the situation in the nonfarm business sector of the economy in which output per hour increased 1.6 percent between 1983 and 1984, after gaining 3.4 percent in 1982–83. Table 1 shows productivity trends in industries measured by the Bureau and includes new measures introduced for additional industries: barber and beauty shops; metal doors, sash and trim; metal stampings; and oilfield machinery.[1]

Changes in manufacturing

Among important manufacturing industries, productivity in the steel industry grew 13.0 percent in 1984. This large gain was in addition to the record productivity advance of 28.5 percent in 1983. Steel output increased more than 13 percent in 1984, due in part to continued demand from such key markets as motor vehicles, appliances, and construction. Employee hours rose only slightly and employment continued to decline, as the industry continued restructuring and the closing of inefficient facilities. The motor vehicles industry had an above average productivity gain of 4.6 percent, in addition to an unusually large gain in the previous year (13.1 percent). Output in this industry was up more than 21 percent in 1984, as demand for all types of motor vehicles expanded, while hours increased almost 16 percent.

Other important manufacturing industries with large gains included steel foundries with a productivity increase of more than 11 percent, while gray iron foundries attained an increase of more than 9 percent in 1984. Output in these industries rose in 1984 as demand from the automobile, construction, and railroad industries expanded. The tire industry posted an 11.3-percent productivity gain in 1984, following a 6.2-percent gain in 1983. Output grew by 14.3 percent in 1984 as demand was up for both original equipment and replacement tires, while hours rose only slightly. In petroleum refining, productivity moved up 10.9 percent in 1984, after gaining 3.0 percent in 1983. Refinery output increased for the first time since 1978, while hours declined, as small refineries contined to close.

Arthur S. Herman is an economist in the Office of Productivity and Technology, Bureau of Labor Statistics.

Other significant manufacturing industries with large productivity gains included malt beverages (10.5 percent), metal cans and primary aluminum (both 10.1 percent), and household cooking equipment (9.7 percent).

A few manufacturing industries registered productivity declines in 1984. These included pharmaceutical preparations (−5.2 percent), hardwood veneer and plywood (−4.8 percent), structural clay products (−3.9 percent), and folding paperboard boxes (−2.6 percent). Although output was up in all of these industries, except for pharmaceuticals where it fell slightly, employee hours rose even more, resulting in the productivity falloff.

Mining

All of the mining industries experienced productivity gains in 1984. Coal mining, the largest mining industry, posted a gain of 10.1 percent in 1984, on top of a 14.2-percent rise in 1983. Coal output was up 14.4 percent in 1984 in anticipation of a strike which did not occur, while hours rose 3.9 percent. Productivity in iron mining (usable ore) increased 25.3 percent, compared with a 41.1-percent gain the previous year. Output was up 36.9 percent in 1984 as demand increased from the steel industry, while hours rose 9.3 percent. Copper mining (recoverable metal) had a productivity gain of 17.6 percent, after a 12.7-percent increase in 1983. Output was up only 5.1 percent in 1984, because of low copper prices, while hours dropped 10.6 percent, as only the most efficient mines were operating. The nonmetallic minerals industry registered a productivity gain of 1.9 percent. Output grew 8.7 percent in this industry, owing to the expansion of construction activity, while hours were up 6.6 percent.

Transportation and utilities

Most transportation and utility industries also recorded 1984 productivity gains. In railroads (revenue traffic), productivity was up 7.5 percent following a 22.5-percent rise in 1983. Railroad output grew 9.2 percent in 1984 as shipments of coal, motor vehicles, construction materials, and chemicals were up significantly, while hours increased 1.5 percent. Productivity grew 3.3 percent in air transportation, compared with a 9.9-percent gain in the previous year. Air traffic increased significantly in 1984, resulting in a 7.9-percent gain in output. In petroleum pipelines, productivity grew 11.1 percent, as output rose and hours continued to fall. Electric utility productivity was up 3.5 percent, as output increased 5.3 percent, and hours were up 1.8 percent. The gas utilities industry registered its first productivity gain since 1979 (3.2 percent), with output increasing 2.5 percent, and hours dropping 0.7 percent.

Trade and services

Productivity changes were mixed among trade and service industries. The hotel and motel industry registered the highest gain, at 7.7 percent. Output was up 15.2 percent in this industry owing to the continuation of the business recovery, as well as a strong summer vacation period, while employee hours grew 7.0 percent. Apparel and accessory stores also registered a good productivity increase, up 6.0 percent. Output increased 9.6 percent in 1984, as favorable economic and credit conditions aided clothing sales, while hours rose 3.4 percent. In laundries and cleaning services, productivity grew 3.3 percent, based on a gain in output of 8.2 percent and an increase in hours of 4.8 percent. Productivity gains were recorded in drugstores (1.8 percent) and gasoline stations (0.4 percent). However, there were productivity declines in several of the service industries. The beauty and barber shop industry had a substantial 8.4-percent decline. Productivity also fell 2.1 percent in eating and drinking places. While output in the restaurant industry was up 3.8 percent in 1984, hours increased even more, resulting in the productivity falloff. Productivity dropped 1.0 percent in retail food stores. New car dealers had a small productivity decline of 0.1 percent. Output was up significantly at 10.8 percent. However, hours rose slightly more, resulting in the productivity decline.

Trends among industries

Almost all of the industries studied recorded average annual gains in productivity over the long term (1947–84 for many of the industries). A few industries experienced long-term declines, however. These included metal stampings, metal forming machine tools, farm machinery, and bus carriers.

Over the most recent 5-year period (1979–84), most of the industries registered a growth in productivity. Slightly more than one-fourth had productivity declines. In addition, almost two-thirds of the industries recorded lower rates of productivity growth from 1979–84 than in the preceding long-term period. The falloff in productivity growth in a majority of the industries is in line with the trend in the nonfarm business sector of the economy, where productivity grew at an annual rate of 1.0 percent from 1979 to 1984, compared with a 2.2-percent rate for 1947–79.

Gains, 1979–84. The highest rate of productivity increase over the 5-year period was recorded by the radio and television sets industry (14.5 percent per year). Productivity growth in this highly competitive industry was aided by widespread use of automatic production techniques and equipment and the closing of less efficient plants. Copper mining (recoverable metal) had the second highest rate of productivity gain, at 10.5 percent. However, this reflected both an output decline and a very sharp decline in hours. More advanced mining methods were introduced and less efficient mines were shut down in an effort to compete with low-priced foreign ore, resulting in the productivity gain. The wet corn milling industry had the third highest rate of gain at 9.7 percent. Here output rose, while employee hours

[1] As defined in the *Standard Industrial Classification Manual*, 1972, published by the Office of Management and Budget.

[2] Preliminary data.

[3] Not available.

[4] Percent change, 1979–83.

[5] Rate of change is less than 0.05 percent.

[6] Output per employee.

[7] Output per hour of all persons.

NOTE: Although the output per employee-hour measures relate output to the hours of all employees engaged in each industry, they do not measure the specific contribution of labor, capital, or any other single factor of production. Rather, they reflect the joint effects of many influences, including new technology, capital investment, the level of output, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the work force. Some of these measures use a labor input series that is based on hours paid, and some use a labor input series that is based on plant hours.

n.e.c. = not elsewhere classified.

fell. Demand continued strong for high fructose corn syrup, a key product of this industry, which is used as a sweetener, especially by soft drink manufacturers. The industry has made substantial capital investment in highly automated plants, allowing for output expansion at the same time as employment was being reduced. Other industries with high rates of gain from 1979 to 1984 include: women's clothing stores (9.4 percent), primary copper, lead and zinc (8.4 percent), railroad transportation (revenue traffic) (8.2 percent), tires (7.9 percent), coal mining (7.7 percent), family clothing stores (7.3 percent), and softwood veneer and plywood (7.2 percent).

Declines, 1979–84. Among the industries with declines, the wood office furniture industry had the greatest falloff in output per hour, dropping at a rate of 5.3 percent from 1979 to 1983. (The 1984 data are not as yet available.) Output decreased at a 4.1-percent rate, while employee hours grew at a 1.3-percent rate. This industry was severely affected by the two recessions which occurred within this period and suffered sharp drops in output and associated declines in productivity. The industry with the second largest falloff was gas utilities, registering an average annual decline of 5.1 percent from 1979 to 1984. Output fell at a rate of 3.8 percent owing to a drop in average use per customer, while the number of customers increased, leading to growth in employee hours at a rate of 1.4 percent. Among other industries with substantial declines were: Machine tool accessories (−4.3 percent, 1979–83), bus carriers (−4.0 percent), machine tools (−3.6 percent), metal stampings (−3.6 percent, 1979–83), ball and roller bearings (−3.5 percent), as well as internal combustion engines and hand and edge tools (both −3.3 percent, 1979–83). ☐

—— FOOTNOTE ——

[1] For a detailed report on these industries, see Brian L. Friedman and Arthur S. Herman, "Productivity growth low in the oilfield machinery industry," *Monthly Labor Review*, December 1985, pp. 34–38; Horst Brand and Ziaul Z. Ahmed, "Beauty and barber shops: the trend of labor productivity," pp. 21-26), this issue; and Elmer S. Persigehl and John G. Olsen, "Productivity in the metal doors, sash, and trim industry," pp. 27–31, this issue. An article on the metal stampings industry will appear in a forthcoming issue of the *Review*.

The contribution of R&D to productivity growth

Results of a BLS study suggest that the direct contribution of research and development to postwar productivity growth was between 0.1 and 0.2 percent annually in the nonfarm business sector; R&D had no substantial effect on the post-1973 productivity slowdown

LEO SVEIKAUSKAS

Many observers believe that research and development (R&D) conducted in U.S. industry is an important ingredient in the Nation's productivity improvement.[1] The Bureau of Labor Statistics has recently conducted work aimed at establishing the contribution of R&D to productivity growth.[2] The study proceeded along much the same lines as prior BLS analysis of the contribution of the physical capital stock to productivity.[3] This work calculated real annual investment in research and development and estimated the R&D stock to determine the annual and long-term productivity effects of research spending in the private nonfarm business sector. This article summarizes the main conclusions which have emerged from that analysis.

Between 1948 and 1982, U.S. multifactor productivity growth—the increase in output beyond the contribution of labor and capital inputs—was 1.2 percent per year. However, the long-term productivity trend for the postwar period reflects very different developments during two distinct subperiods. Multifactor productivity increased at an annual rate of 1.7 percent from 1948 to 1973, but then decreased by 0.2 percent per year through 1982. The results reported below indicate that the R&D stock contributed 0.1–0.2 percent annually to 1948–82 productivity growth, but had no substantial effect on the 1973–82 productivity slowdown.

Research and development provides both *direct* productivity benefits to industries conducting research, such as computer or aircraft manufacturers, and *indirect* benefits to industries further along the chain of production, as occurs when banks take advantage of new computer technology or commercial airlines realize gains from the purchase of better aircraft. This study deals only with the direct productivity benefits accruing to industries actually conducting the research. The reader should realize that, on balance, the indirect benefits gained as new technology spreads to other parts of the economy are likely to be greater than the direct contribution of research. Future Bureau work will attempt to determine the magnitude of these indirect effects.

Main elements of the analysis

At least eight distinct issues have to be considered in developing an estimate of the R&D stock and determining its influence on productivity growth. The following discussion summarizes the decisions that the Bureau reached on each of these matters. In several instances, economic understanding is at present not sufficient to support a definite judgment concerning the proper treatment of an issue. In these cases, an assumption which appears reasonable in light of prior

---

Leo Sveikauskas is an economist in the Division of Productivity Research, Bureau of Labor Statistics.

analysis was selected for use in the "preferred" model. However, sensitivity analyses also examined the effect of other plausible assumptions on conclusions about the relationship between R&D and productivity growth.

Defining the R&D stock. The first and main issue is determination of the components of research that should be included in the R&D stock, which establishes the central framework for the study. BLS measures of productivity in the major economic sectors rely upon data published in the national income accounts. Therefore, the components of research that should properly be included in the R&D stock are those that *directly* affect productivity growth as measured within the context of the national income accounts. Most analyses of R&D indicate that only privately financed research directly affects typical measures of productivity.[4] However, there is also some evidence that government-financed research conducted in industry affects measured productivity, although less strongly.[5]

In view of this information, the preferred measure of the R&D stock selected for this study includes only privately financed research conducted in industry and the relatively small, privately financed projects conducted in colleges and universities or nonprofit institutions, which are assumed to be similar in nature. However, the sensitivity analyses discussed below also consider an alternative measure that includes government-financed research conducted in industry, weighted at 20 cents on the dollar.

The Bureau's definition of the R&D stock includes both product and process research, and both basic and applied research, although separate accounts are kept for the latter two categories to permit differential treatment of lag and depreciation issues. The R&D stock is here limited to research conducted by U.S. industry. Detailed specification of the influence of foreign research on the U.S. economy remains an important topic for future empirical investigation.

Locating appropriate data. Once the relevant definition of R&D was decided, it was necessary to obtain data on annual expenditures for the categories of research included. Annual publications of the National Science Foundation provide the necessary information from 1953 onwards.[6] Nestor Terleckyj has prepared similar consistent annual data on private R&D expenditures for the years 1921–52.[7] The alternative measure of the research stock, which includes government-financed research conducted in industry, relies on data developed by David Blank and George Stigler.[8]

Converting to constant dollars. The third step in the analysis requires selection of an appropriate R&D deflator to convert annual research spending into constant-dollar terms. The National Science Foundation uses the GNP deflator for this purpose, although it is widely recognized that this series provides only a very rough approximation. Zvi Griliches has suggested an alternative deflator that weights the output price deflator for nonfinancial corporations at 0.51 and the unit compensation index for the same sector at 0.49.[9] The BLS study adopts the Griliches deflator, suitably modified to adjust research expenditures occurring before 1958, the first year for which nonfinancial corporations data are available.

Determining the appropriate lag time. Once real annual research expenditures are estimated, the lag between the time research is conducted and the time it affects productivity must be considered. On the basis of a review of the relevant literature, a 2-year lag was selected for applied research and a 5-year lag was chosen for basic research. One-year and 3-year lags for applied research were examined in the sensitivity analyses.

Treating depreciation. A fifth crucial issue is whether the R&D stock depreciates over time, in the sense of contributing less to output. If so, what is the time path and pattern of this depreciation? The literature contains a broad range of conclusions on this topic, from some which suggest that R&D investments do not depreciate at all to others which indicate rapid depreciation of research expenditures.[10]

For this study, a depreciation pattern known as 0.1 geometric decay, which implies that 10 percent of the research stock depreciates each year, was selected as the preferred choice for applied research. Basic research was assumed not to depreciate. The sensitivity analyses also examine the effects of alternatively assuming zero or 0.2 geometric decay for applied research. As the discussion of the findings shows, the choice of a rate of depreciation has a substantial impact on conclusions concerning the effect of R&D on productivity growth. Unfortunately, not much is definitively known about depreciation of the R&D stock.

Calculating the R&D stock. The research stock was calculated using standard perpetual inventory methods which determine each year's net change in the stock by allowing for new investment and for depreciation.

Deciding on a rate of return. The seventh matter to be considered is the appropriate rate of return to apply to the research stock to determine its contribution to productivity growth. On the basis of a broad range of empirical studies, a 30-percent real rate of return was selected for use in the preferred measure.[11] On the basis of a review of the relevant literature, it was assumed that there has been no decline in the rate of return over time.[12] However, the sensitivity analyses also examined the impact on productivity growth if there has been a substantial decline in the rate of return to R&D over time.

Determining the impact of R&D. In the final step, information on the R&D stock and its assumed rate of return was combined to estimate the impact of research on productivity. This was determined by calculating the research share of output in the private nonfarm business sector and multiplying this share by the growth rate of the research stock. Such a procedure is standard in analyzing the contribution of inputs to economic growth.

In these calculations, the research stock is first multiplied by the assumed real rate of return (.30) to determine annual-real research income. Research income is then divided by real output in the private nonfarm business sector to obtain the research share in the sector. Finally, the research share is multiplied by the annual percentage increase in the R&D stock to determine the contribution to productivity growth.[13]

Empirical results

Table 1 presents the preferred estimates of the impact of R&D on productivity growth. All results are for the private nonfarm business sector for the 1948–82 period.

Column 1 shows the R&D stock of the sector in 1972 dollars. Over the 1948–82 period, the research stock grew at an average annual rate of 6.8 percent. From 1948 to 1973, growth was 7.8 percent a year, but the pace slowed considerably—to 4.3 percent—during the 1973–82 period.

Estimates of year-to-year change in column 2 also indicate that the growth of the R&D stock slowed substantially in the 1970's. By that time, however, the research share of sector income (column 5) was considerably greater than it had been in the immediate postwar years because of the consistent substantial growth in the R&D stock. The weight of research in the economy was therefore greater in recent years, and each percentage-point increase in the R&D stock made more of a contribution to output growth. Consequently, the overall contribution of R&D held up better in the 1970's than the slowing growth rate of the research stock itself would suggest.

Estimates for the subperiods 1948–73 and 1973–82 indicate that R&D had no substantial impact on the post-1973 productivity slowdown. From 1948 to 1982, R&D contributed 0.14 percent a year to multifactor productivity growth. Subperiod rates were essentially the same: 0.14 percent from 1948 to 1973, and 0.13 percent from 1973 to 1982.[14]

The annual productivity contributions shown in column 6 provide a more detailed view of the impact of R&D on productivity. The annual productivity contribution ranged between 0.16 and 0.18 in the 1960's, but declined to about 0.11 to 0.12 in the late 1970's. However, by the early 1980's, the productivity contribution of R&D had essentially returned to the magnitudes reached in the 1960's.

Other major sectors. The analysis so far has concentrated on the impact of the research stock in the nonfarm business sector. It is difficult to obtain a reliable time series for direct private research investment in the farm sector, and that sector is therefore not examined here. The heavy expenditures by Federal and State governments on agriculture can probably best be viewed as indirect research provided to the farm sector by other industries, and therefore are also not considered in this report.

In addition, it is difficult to establish a reliable basis on which to divide nonfarm business research between its manufacturing and nonmanufacturing components. Tentative estimates suggest that research and development may have contributed as much as 0.41 percent per year to 1948–82 productivity growth in manufacturing, but only 0.01 percent to direct productivity growth in the nonmanufacturing sector. These very different effects of the direct impact of research arise because an extremely large proportion of direct research spending takes place in manufacturing.

Table 1. Central variables and results from analysis of the effects of research and development on productivity growth, private nonfarm business sector, 1948–82

[In billions of 1972 dollars, unless otherwise indicated]

Year	R&D stock		Output of private nonfarm business[1] (3)	Real R&D income[2] (4)	R&D share of total output[3] (in percent) (5)	R&D contribution to productivity growth[4] (in percent) (6)
	Level (1)	Annual growth rate (in percent) (2)				
1948 . . .	$13.5	—	$364.5	$4.0	—	—
1949 . . .	14.6	8.8	357.5	4.4	1.2	0.10

1982 . . .	127.7	4.8	1083.4	38.3	3.4	.16

[1] Constant-dollar output of the sector. All calculations were conducted prior to the January 1985 GNP revisions.

[2] Column (1) × 0.30, under the assumption of a 30-percent rate of return on the research stock.

[3] Column (4) divided by column (3).

[4] To illustrate the methodology adopted to generate these estimates, the 1948–49 growth in the research stock, .088 (or 8.8 percent), is multiplied by the research share, .012 (or 1.2 percent), to determine the productivity contribution, which is .0010, or 0.10 percentage points. Text footnote 13 describes the actual method used, which tends to result in slightly lower contributions.

Sensitivity analyses

The preferred results summarized above are based on a 2-year lag between applied research and its effect on productivity, 0.1 geometric depreciation, use of the Griliches deflator to convert research expenditures into real terms, inclusion of only privately financed research, and a constant rate of return to the research stock over time. But, as indicated earlier, these assumptions are subject to some uncertainty because much remains to be known about the economics of R&D. Therefore, a sensitivity analysis was conducted to determine how other plausible assumptions affect the central conclusions concerning the influence of R&D. The first line of table 2 lists the productivity impacts with the preferred assumptions. These figures provide the base-case framework, which is used as the standard of reference for examining the effects of using alternative assumptions in the model.

Changes in the lag before applied research influences production have little effect on long-term productivity growth. If a 1-year lag is adopted, the R&D impact is slightly greater (line 2), essentially because the research stock is then somewhat larger. However, there is no substantial change in the effect of R&D on productivity. If a 3-year lag is assumed instead (line 3), there is no change at all in the implied influence of R&D on productivity growth.

In contrast, changes in the assumed rate of depreciation have a major impact on the implied influence of R&D. If there is zero depreciation, the research stock increases more rapidly and is larger at every given time, both of which suggest that R&D contributes more to productivity. With zero depreciation (line 4), research contributes 0.33 percent to 1948–82 productivity growth; the 1948–73 contribution of 0.31 percent increases to 0.40 percent in 1973–82 as the R&D stock continues to grow.

Table 2. The effect of alternative assumptions on the implied influence of the research and development stock on productivity growth, 1948–82 and two subperiods

Alternative assumption	R&D contribution to productivity growth[1] (in percent)		
	1948–82	1948–73	1973–82
1) Preferred estimate	0.14	0.14	0.13
2) 1-year lag for applied research	.15	.15	.14
3) 3-year lag for applied research	.14	.14	.13
4) Zero depreciation of applied research	.33	.31	.40
5) 0.2 geometric depreciation of applied research	.09	.10	.08
6) GNP deflator used to deflate research expenditures	.14	.14	.14
7) Two-tenths of Federally funded research conducted in industry counted in the research stock	.16	.17	.13
8) The real rate of return to research declines over time[2]	.13	.14	.10

[1] See footnote 4, table 1.

[2] Assumes a linear decline from 30 percent in 1967 to 20 percent in 1982.

Conversely, if 0.2 geometric decay is assumed for applied research (line 5), the R&D stock grows more slowly and is smaller, so that R&D contributes only 0.09 percent to 1948–82 productivity growth, 0.10 percent in 1948–73 and 0.08 percent in 1973–82. These amounts are moderately less than in the preferred case. Because the depreciation of R&D has important implications for the role of the research stock in productivity growth, further study of this issue would be highly useful.

If the GNP deflator is used instead of the Griliches deflator (line 6), the original results are not greatly changed. However, if two-tenths of the Federal expenditures for research conducted in industry are included (line 7), the 1948–82 productivity contribution is 0.16 percent, reflecting the greater research stock. In addition, R&D plays a greater role in the productivity slowdown, with its contribution declining from 0.17 percent in 1948–73 to 0.13 percent in 1973–82. This reflects the fact that the growth of Federally financed research conducted in industry slowed more during the 1970's than did privately financed research spending. Nevertheless, even if the Federal funds are included, the implied R&D effects on productivity growth (and the productivity slowdown) are not very great.

Finally, line 8 presents the case in which the rate of return declines linearly from 30 percent in 1967 to 20 percent in 1982. The productivity contribution of R&D is slightly lower for 1948–82 as well as for 1973–82. However, once again the contribution to the productivity slowdown is less than one-tenth of a percentage point.

In summary, the preferred estimates of the impact of R&D on productivity growth are fairly robust with respect to changes in the central assumptions used in constructing them. The exception is the rate of depreciation: under the zero depreciation assumption, the effect of R&D on productivity is substantially greater.[15]

THE CONCLUSIONS drawn here must be qualified because they deal only with the *direct* return to research and development. The indirect effects of research are likely to be greater, but because they take longer to appear, the slowdown in research spending in the late 1960's and the 1970's is probably not yet fully reflected in productivity measures. The Bureau of Labor Statistics plans further study of the indirect effects of R&D.

More generally, although R&D has received much attention, it represents only a portion of the many social and individual activities relevant to technical progress. Managerial and organizational quality, the integration of the industrial relations system with effective technological change, and technological achievements by individual inventors or entrepreneurs all are important facets of technical change. These aspects of innovation are also likely to have had a substantial impact on productivity growth but are, regrettably, extremely difficult to quantify on a comprehensive national basis. □

[11] There are two types of studies which provide evidence on the rate of return to research and development: regression studies of industry or firm productivity growth and studies of returns to specific representative R&D projects. Regression evidence is subject to many well-known qualifications, such as omission of relevant variables. Therefore, it is important to emphasize that the studies of the returns to specific research projects suggest conclusions broadly comparable with the evidence from the regression analysis of productivity. The consistency between these two different strands of evidence greatly increases the confidence which can be placed in the implied relationship between R&D and productivity growth.

Important regression studies include Zvi Griliches, "Research Expenditures and Growth Accounting," in B.R. Williams, ed., *Science and Technology in Economic Growth* (New York, Macmillian Co., 1973), pp. 59–95; Nestor E. Terleckyj, *Effect of Research and Development on the Productivity Growth of Industries: An Exploratory Study* (Washington, National Planning Association, 1976); Zvi Griliches, "Returns to Research and Development Expenditures in the Private Sector"; Leo A. Sveikauskas, "Technology Inputs and Multifactor Productivity Growth," *Review of Economics and Statistics*, May 1981, pp. 275–82; Frederic M. Scherer, "Interindustry Technology Flows and Productivity Growth," *Review of Economics and Statistics*, November 1982, pp. 627–34; and Zvi Griliches and Frank Lichtenberg, "Interindustry Technology Flows and Productivity Growth: A Reexamination," *Review of Economics and Statistics*, May 1984, pp. 324–29.

The most important studies of the returns to representative projects are Edwin Mansfield, John Rapoport and others, "Social and Private Rates of Return from Industrial Innovations," *Quarterly Journal of Economics*, May 1977, pp. 221–40; and J. G. Tewksbury and others, "Measuring the Societal Impact of Innovations," *Science*, Aug. 8, 1980, pp. 658–62, including the further references cited there.

Many regression studies of the impact of research and development on productivity growth measure the increase in the research stock as observed research spending. If research investments depreciate, these regression studies may substantially underestimate the true return to research. In this context, the Mansfield case-study evidence was especially helpful in ensuring that the return to research selected for the present study is realistic.

[12] Studies which find no substantial change in the rate of return to R&D over time includes Zvi Griliches and Frank Lichtenberg, "Interindustry Technology Flows"; Kim Clark and Zvi Griliches, "Productivity Growth and R and D at the Business Level: Results from the PIMS Data Base," in Griliches, ed., *R and D, Patents and Productivity*, pp. 393–416; and Griliches, "Productivity, R and D and Basic Research at the Firm Level in the 1970's."

A somewhat earlier study presents evidence indicating the rate of return to research may have declined and considers some of the reasons why such a declining return is plausible. See Edwin Mansfield, "How Research Pays Off in Productivity," *EPRI Journal*, October 1979, pp. 25–28.

[13] The share of research and development in any year can be calculated by multiplying the research stock times the assumed real rate of return (.30) to obtain implied real research income, and dividing the result by real output.

The research share indicated for each year in table 1 is obtained by calculating S_{t-1}, the research share for the first year of any binary comparison, and S_t, the corresponding research share in the second year. The share used, S_t^*, is then calculated as $S_{t-1} + S_t)/2.0$, or the average share for the two years in question. The contribution to productivity growth is then obtained from $S_t^* (logR_t - logR_{t-1})$, where R_t and R_{t-1} are the values of the research stock in the two years under consideration. The logarithmic form here indicates that growth rates are measured in continuous rather than discrete terms. Appendix A of the forthcoming BLS Bulletin *Research and Development and Productivity Growth* provides more complete information on the procedures used here.

The bulletin also includes a more detailed discussion of the various ways in which economists have examined the impact of R&D and the many complex issues which must be addressed in developing quantitative measures. Current understanding in this area leaves several important matters unresolved. In particular, the possibility of quality improvement in the R&D sector and the interactions between basic and applied research deserve further attention.

[14] The average annual productivity contribution for each of the periods considered was calculated as the geometric mean of the relevant annual contributions listed in column 6 of table 1.

[15] However, with the zero depreciation assumption, the contribution of R&D increases about one-tenth of a percentage point from 1948–73 to 1973–82; R&D not only does not contribute to the productivity slowdown, but is a positive force which tends to offset some of the slowdown occurring for other reasons.

Beauty and barber shops: the trend of labor productivity

Output per hour of persons employed in these shops rose at an annual rate of 0.8 percent between 1972 and 1984, in line with the productivity trend for other personal service industries

HORST BRAND AND ZIAUL Z. AHMED

Output per hour of persons employed in the beauty and barber shop industries rose at an average annual rate of 0.8 percent between 1972 and 1984.[1] Other industries with a high personal service component show roughly comparable trend rates, including the hotel and motel industry.

Output of beauty and barber shops remained virtually unchanged between 1972 and 1984, while hours dipped 0.6 percent a year. (See table 1.) The comparative weakness in output and hours was linked to sharp contractions in the number of barber shops. Beauty shops recorded some gains in output and a small long-term rise in hours.[2]

The output-per-hour trend rates for the two industries combined, as well as for beauty shops separately, mask pronounced year-to-year fluctuations. These, in part, reflected short-term volatility in the productivity mainly of beauty shops. Such volatility has probably been linked with lags in the adjustment of labor inputs to output changes—accounting for a relatively tight supply of labor in relation to output in "good" years, and for excess supply in "off" years. In beauty shops, productivity fluctuated between a rise of 8 percent (in 1984) and a drop of 6 percent (in 1976). The gains were associated with output rising more than hours (or with hours declining)—except in 1981 when productivity increased because of a decline in output that was less than a decline in hours. Losses were all linked with a decrease in output accompanied by additional hours.

A change in the productivity trend in the two industries occurred after 1976. Between 1972 and 1976, output per hour fell in both industries; in beauty shops, it decreased at an average annual rate of nearly 4 percent. Subsequently, it rose 2.4 percent a year. The productivity drop during the 1972–76 period was to some extent associated with a strong increase in the service capacity of beauty shops, as indicated by expanding self-employment—accompanied by a change in hair styling fashions that *reduced* certain styling service requirements. The productivity rise after 1976 was linked with declining self-employment, and with fashion changes that called for more styling services.

Demand and output

Beauty shops render up to 12 distinct types of services; barber shops up to eight. Workers in both industries mainly cut hair; many establishments confine their service to hair cutting. In addition to haircuts, full-service beauty shops offer permanents, coloring, conditioning, and manicures; a few offer pedicures. A limited number of shops also perform facials and other cosmetical skin treatments. They also fit

---

Horst Brand And Ziaul Z. Ahmed are economists in the Division of Industry Productivity and Technology Studies, Bureau of Labor Statistics.

and service wigs. Their patrons often include men. The range of barber shop services is generally narrower, although styling and shampooing of men's hair have increased somewhat in importance. Women are also served.

Service output of beauty shops did not display a notably strong long-term trend, rising at an average annual rate of 1.4 percent between 1972 and 1984. Service output of barber shops declined at a rate of 4.8 percent a year during that period. The decline in barber shop output was somewhat erratic. The long-term uptrend in beauty shop service output obscures a rather sharp falloff between 1972 and 1976 that was subsequently reversed. Until 1976, beauty shop service output dipped 3.3 percent a year; thereafter it rose 2.6 percent a year. Neither the output of total consumer services nor of the consumer service industries for which the Bureau of Labor Statistics computes pertinent measures so strongly reversed trend during the decade (average annual rates, in percent):[3]

	1972–84	*1972–76*	*1976–84*
All services, except government	4.7	3.7	5.2
All consumer services	3.6	3.5	3.3
Beauty shops	1.4	−3.3	2.6
Barber shops	−4.8	−4.5	−5.6
Hotels, motels	3.9	3.0	3.5
Eating and drinking	2.7	3.1	2.2
Laundry and drycleaning	−2.8	−6.6	−1.9

Among reasons is that beauty shops are subject to changes in hair styling fashions, and these were quite far-reaching during the 1970's. Such changes have often shifted some elements of hair care from beauty and barber shops to the home (do-it-yourself), and vice versa.

Trade publications data and interviews with industry representatives confirm that the mix of services offered by beauty shops changed significantly between 1972 and 1984, as styles changed. In the late 1960's and early 1970's, long hair became popular and required more attention by hair stylists than the fashions that followed. Bouffant hairdos, which entail much back-combing ("teasing") and setting, hence additional labor, were still popular.[4] After about 1972, shorter hair and the "natural look," requiring less styling and setting, came to be preferred, somewhat diminishing the need for professional styling.[5] Women now tended to visit beauty shops chiefly for trimming of their hair, often washing it themselves. This reduced the time needed for such services as shampooing and setting of the hair.[6] Hair coloring, which had been popular during the early 1970's, declined in relative importance as the "natural look" gained favor. The demand for "wash and wear" permanenting rose strongly throughout the 1970's, because it permitted minimum maintenance of hair style and lessened visits to beauty shops.[7]

Moreover, longer hair among men came into fashion, and men who preferred to have their hair professionally groomed increasingly visited beauty shops.[8] "Unisex" salons, usually featuring limited services common to the hair styling needs of both sexes (hair cut, permanent wave, and shampoo), spread. The expansion of unisex salons, with their emphasis on walk-in, no-wait service (no appointments), represented a basic marketing shift; and has been a factor in the persistent decline in the number of barber shops.[9]

Table 1. Productivity and related variables in the beauty and barber shop industries 1972–84
[1977=100]

Year	Beauty shops[1]			Beauty and barber shops[2]		
	Productivity	Output	All person hours	Productivity	Output	All person hours
1972	110.1	103.9	94.4	105.0	108.6	103.4
1973	106.2	102.1	96.1	100.7	106.8	106.0
1974	106.2	99.6	93.8	101.4	101.5	100.1
1975	100.1	94.5	94.4	98.7	97.6	98.9
1976	94.3	91.3	96.8	95.0	94.4	99.4
1977	100.0	100.0	100.0	100.0	100.0	100.0
1978	104.7	106.2	101.4	103.6	105.3	101.6
1979	108.0	108.4	100.4	107.4	105.6	98.3
1980	106.2	107.2	100.9	102.9	103.6	100.7
1981	114.7	105.1	91.6	109.2	99.9	91.5
1982	113.1	103.6	91.9	108.3	97.8	90.3
1983	120.0	119.4	99.5	114.1	109.8	96.2
1984	111.7	119.7	107.2	104.5	108.5	103.8
Average annual percent change:						
1972–84	0.9	1.4	0.5	0.8	0.2	−0.6
1979–84	1.5	2.3	0.8	0.5	0.8	0.3

[1] Standard Industrial Code 723.

[2] SIC 723 and 724 combined.

The change in fashions and the resultant shift in the services performed by beauty and barber shops apparently did not much affect labor requirements. The proportion of labor costs in beauty salons' total operating costs averaged around 60 percent throughout the period. While permanenting gained and hair coloring lost in relative importance, the two together have evidently accounted for roughly one half of the work performed in beauty shops. The relative importance of shampooing, conditioning, and trimming of hair seems to have changed little over the period.[10] The range of barber shop services generally remained narrow, with haircuts outranking their other services. However, hair styling has increasingly added to the quality of barbers' hair cutting service.[11]

The fashion changes that occurred in the early 1970's loosened the traditional relation between beauty shop services, household incomes, and changes in the age composition of the female population.[12] The age distribution of employed women age 35 to 54 changed little, and this group, according to an industry survey, has the greatest probability of visiting beauty shops and the highest frequency in doing so. The proportion of employed women in this age group declined from 38 percent in 1972 to 34 percent in 1977, then rose to 37 percent in 1984.[13] Overall, employment of women rose at an average annual rate of

3.3 percent between 1972 and 1984, and median income (in current dollars) of women working full time increased at an estimated rate of 8 percent a year. The rise in women's employment and income proved paradoxical. It often meant that less time was available for visits to beauty shops, and more hair care was performed at home. Moreover, many women apparently preferred unisex salons, offering no-frills service. However, women could afford to patronize full-service salons more frequently.[14] In general, according to the survey, the frequency of beauty salon visits rises with income. Yet, pressure of time may reduce the services requested or desired by the client.

Despite the increase in the output of beauty shops since the mid-1970's, constant-dollar receipts of both beauty and barber shops declined steadily as a proportion of total personal consumption expenditures for services, falling from 1.2 percent in 1972 to 0.7 percent in 1982.

Employment and industry structure

Employment in beauty and barber shops, including payroll as well as self-employment, totaled 692,000 persons in 1984. It did not, on balance, change significantly over the 1972–84 span. Hours declined at an average annual rate of 0.6 percent, partly reflecting a continual shift to part-time schedules.

Annual employment and hours data for barbershops are of but limited validity.[15] However, pertinent data collected by the Bureau of the Census for census years show that the number of barber shops declined 25 percent between 1972 and 1977. The number of paid employees dropped 17 percent over that period, with a further 25-percent decrease indicated for the 1977–83 span. Self-employment, as indicated by the number of proprietorships and partnerships, dropped by just over one-third between 1972 and 1983.[16]

Census data show that the great majority of barber shops do not employ wage or salary workers. The one-sixth which do account for close to one-half of receipts. Of barber shops with payrolls, one-fifth employs half of the payroll employees in the industry. Most of the others engage one or two paid workers, with the owner or owners also working.

Employment in beauty shops, which totaled about 591,400 persons in 1984, rose at a rate of 1.1 percent a year over the 12-year period. It increased even in years of declining service output, except in 1981 when it dropped sharply, and in 1974 when it remained unchanged from the previous year. Hours responded somewhat more closely to movements in output, rising at a rate of 0.5 percent between 1972 and 1984. For 1982, the BLS estimates that nonsupervisory beauty shop workers averaged 29.6 hours per week, reflecting a high part-time component, and that part-time schedules accounted for 39 percent of employed workers.[17] This represents a far higher proportion than for employed workers generally, of whom only 13 percent were on voluntary part time (in 1984); or for service workers (other than in private households), of whom 18 percent worked part time.

While two-fifths of all beauty shops employ wage or salary workers, they account for four-fifths of the industry's total receipts. On average, beauty shops with payrolls employ four workers. However, 60 percent of the payroll employees work in only 30 percent of all beauty shops, averaging eight workers per shop. In addition, the owner or owners also perform beauty services (industry sources believe 90 percent do so).

Self-employment in barber shops dropped much more sharply over the 1972–83 period (35 percent) than payroll employment (25 percent); and it rose a bit more in beauty shops (15 percent) than payroll employment (14 percent). It was mainly the small beauty shop with one or two paid employees whose numbers dwindled. It is of interest to note that *self-employment* in beauty shops attained a peak in 1980 that was 19 percent above the previous high, reached in 1972. But in 1983, self-employment was 4 percent below the 1980 mark. The leveling off in beauty shops' *payroll employment* was much more moderate.

While total employment (all persons) in beauty and barber shops combined did not change significantly between 1972 and 1984, employment in industries with a large personal service component generally rose rapidly. In general, in industries that may be defined as consumer-oriented services with a high personal-service component, employment increased at an average annual rate of 3.8 percent between 1972 and 1984, or by 53 percent.[18]

Both barbers and hair stylists—often referred to as cosmetologists—are skilled workers, and are required to obtain up to 1,800 hours of training in most States, as well as to be licensed. While hourly earnings do not compare favorably with the average for private nonfarm industries or for service industries generally, comparisons are not entirely valid because beauty and barber shop workers receive tips, and are generally paid on a commission basis.[19] However, there is a large reserve pool of licensed but inactive hair stylists, estimated by industry observers at several times the number actually working. The potential competition tends to constrain pay increases.[20]

Efficiency and tools of the trade

No official data on the capital expenditures of the beauty and barber shop industries are available. However, the Bureau of the Census reports the value of shipments by manufacturers of barber and beauty chairs, other furniture, and equipment (including hair clippers) for the two industries. The value of such shipments amounted to $47.5 million in 1982; this represented a decline from both 1977 and 1972 when the pertinent figures are adjusted for price changes. Beauty and barber shop personnel, of course, use many kinds of tools manufactured in a broad variety of industries, so that the above figure for the heavier types of equipment understates the two industries' total equipment outlays. Trade sources indicate beauty shop expenditures of $46.4 million in 1982 for appliances, such as hand dryers, and for such durable sundries as shears and scissors.[21] That would suggest total equipment expenditures of close to $100 million in 1982 by the two industries. (No reliable estimate for outlays for structures and structural fixtures can be offered.)

Barbers and hair stylists use a variety of powered and unpowered handtools, often in conjunction with small electrical appliances (such as heat lamps), as well as shampoos, tints, and conditioning solutions in performing their work. There have been and continue to be improvements in both the equipment they use and the solutions they apply. These improvements, however, are designed primarily to facilitate adaptation to changing hair styles, rather than to reduce labor requirements per patron served for the same hair style or category of service.

The use of cordless, rechargeable clippers and trimmers allows the operator greater freedom of movement. It is debatable whether these devices have lessened unit labor requirements. Industry observers in the barbering trade, where the electric clipper was introduced long ago, doubt that this device has significantly reduced the time needed for men's or boys' haircuts, although it is much less laborious to use than the unpowered clipper, which it replaced. Similarly, shampoo machines, introduced in barber shops 15 to 20 years ago with the expectation that they would save time, do not significantly lessen the time needed for the average haircut, although the machines may make the service more agreeable to the customer.[22]

Electric blowers have tended to replace dryers. They are easier to manipulate in conjunction with blow drying or styling. Blowing is thought to be less quick than heat drying but conforms more readily with so-called "wash-and-wear" hair styling and the "casual" hair styles in fashion among both women and men. More than a decade ago, formalized hair-setting practices required operators to use setting lotion, pins or rollers, and dryers. The practice, and the fashion that gave rise to it, are no longer popular, thereby reducing labor requirements. However, some establishments (and patrons) continue to prefer the more formalized hair styling practices and dryers.[23]

Combs made of better plastics are now more pliable and run more easily through the hair, and last longer. Brushes are now easier on the scalp, more specialized to type of hairdo, and also last longer. Shears are shorter to give the operator greater control in trimming hair; they also are made of better metals, require less frequent sharpening, and produce a cleaner cut. Easier to use curling irons have also been introduced.[24] Industry observers generally agree that these developments have not significantly reduced unit labor requirements, although operator effort has been eased by them.[25]

This also holds generally for the solutions applied in washing, setting, conditioning, and tinting of hair. Thus, shampoos clean the hair, but they also tend to dry it out. Additives have been developed which inhibit this drying process. Permanent wave solutions and tints are more gentle and do less damage to the hair's molecular structure.[26] Tints are now manufactured in the form of creams rather than liquids, which tends to improve the hair's appearance. But the hair stylist must still divide the hair every 16th of an inch for proper tinting to reach the roots. The improved tint has not materially shortened the time required for the work.[27]

Permanent-wave solutions have been developed that time permanents automatically and permit the hair stylist to remove the curling rods without testing the curl for proper setting. In principle, this shortens labor requirements for this particular service. However, because of the variance in hair texture, the stylist may be reluctant to follow the manufacturer's instructions to the letter. She or he may be guided by, but not entirely rely upon, the automatic setting prescribed by the manufacturer. The stylist will generally be less concerned with saving time than with the quality of the service rendered to the patron, although in busy beauty shops there may be conflicting pressures.

Technological changes occurred during the decades prior to the period studied here that led to the expansion of the beauty shop industry and the contraction of barber shops.[28] Thus, the advent of the permanent-wave machine in the 1920's shifted women's hairstyling from the home to the market. The "cold wave," a chemical means of curling hair in conjunction with curlers, accelerated the shift in the late 1940's and 1950's. By contrast, the invention of the safety razor, and its diffusion when its price dropped after the patent had expired, shifted shaving from the barber shop to the home; the electric razor, widely marketed first during the 1930's, completed the shift. Thereafter, the work of barber shops was by and large confined to hair cutting. Beauty shops have almost always been under competitive pressure from hairstyling products for home use, but generally they have been able to overcome this pressure by improving quality of service and of the service environment.

Outlook

It appears likely that the basic skills of hair stylists and barbers will continue to resist, as they have in the past, the kinds of technological change that incorporate them in mechanical devices. Industry observers do not foresee technological innovations on the scale of the permanenting machine, discussed earlier, which fed the expansion of the beauty shop industry prior to the 1972–84 period. Industry observers also believe that hair styling and barbering, being highly personalized services, should not be surrounded by impersonal technologies and "gadgetry." Hand-held tools of the beauty and barber trades will probably continue to become better adapted to hair styling and trimming tasks, and the chemical applications required for setting, conditioning, and coloring of hair should continue to become more serviceable.[29] But it is not clear that they will be more labor-saving than tools currently in use.

Certain organizational (or structural) changes in both industries have occurred (and should continue to occur), which tend to standardize operational practices and set models of managerial efficiency. Thus, as of 1983, 19 firms listed by the U.S. Department of Commerce franchised (or operated) more than 2,000 beauty and barber shops. In addition, training services were offered as part of exclusive product-sales franchises to more than 5,000 shops.[30]

Consulting services are now available to assist in setting up and equipping salons. They offer a variety of services, such as architectural and interior design, advertising programs, and managerial and financial advice.[31] Salon management systems have been widely accepted by the larger shops. Their originators provide computer software and advice in its use. The business and financial side of salon management may thus increasingly come to be handled by outside firms under contract with the salon owner. In turn, performance standards of employees more in line with operating costs may be more readily formulated and may improve operational efficiency in both industries, as the standards diffuse.[32] □

FOOTNOTES

[1] The two industries for which productivity is discussed here have been designated as SIC 723 (beauty shops) and SIC 724 (barber shops) in the Office of Management and Budget's *Standard Industrial Classification Manual, 1972*. Beauty shops are primarily engaged in beauty services; barber shops are primarily engaged in furnishing barber and men's hair styling services. Combination beauty and barber shops are classified as SIC 723. Beauty schools and barber schools are included in the respective industries.

A separate productivity measure for barber shops has not been published because of the limited reliability of employment data.

Average annual rates of change are based on the linear least squares trends of the logarithms of the index numbers. The measures of productivity will be updated and included in the annual BLS bulletin, *Productivity Measures for Selected Industries*.

[2] For an earlier study of productivity in beauty and barber shops, see Jean Alexander Wilburn, "A Contrast in Productivity Trends Within Personal Services: The Beauty and Barber Shop Industries," in Victor R. Fuchs and Jean Alexander Wilburn, *Productivity Differences Within the Service Sector* (New York, National Bureau of Economic Research, 1967). pp. 55–109. The study covered the 1939–63 period, but used census-year rather than annual data. The Wilburn study and BLS findings compare average annual rates of change, in percent, for 1939–63 and 1972–82 as follows:

	Barber Shops		*Beauty Shops*	
	1939–63	*1972–84*	*1939–63*	*1972–84*
Current dollar receipts	5.7	1.5	7.8	9.3
Price	5.2	7.0	3.8	7.5
Real output	0.5	−4.8	4.0	1.4
Employment	−0.1	−3.5	2.5	1.1
Real output per person	0.6	−1.3	1.5	0.2

[3] The rates of change are derived from constant-dollar personal consumption expenditures for services published by the Office of Business Economics, U.S. Department of Commerce. The figures for consumer services are derived from constant-dollar personal consumption expenditures for services, Office of Business Economics, U.S. Department of Commerce. Also see footnote 18.

[5] *Modern Beauty Shop*, January 1973, p. 40 ff.

[6] Industry information. According to an advertisement by the Wella Corporation (*Modern Beauty Shop*, February 1974, p. 84), "no fuss, wash and wear" hair styling was becoming popular. There was also a demand for changeable styling and associated paraphernalia, such as hot combs and hot rollers. Because of a greater chance of hair becoming damaged, a trend toward conditioning of hair developed to regain and retain its normal appearance and protect it from damage.

[7] Information from National Hairdressers and Cosmetologists Association, St. Louis, MO.

[8] Information from the Beauty and Barber Supply Institutes, Englewood, NJ. See also *The Wall Street Journal*, May 1978, p. 40.

[9] Beauty and Barber Supply Institute.

[10] See the annual surveys of the professional salon market in *Modern Salon* and its predecessor publication, *Modern Beauty Shop Magazine*. The market surveys show beauty shop suppliers' purchases from manufacturers, by product classification. The publisher confirms that the surveys are indicative of the volume of beauty shop services to which the product classification pertains. The proportions (in percent) of distributor purchases of key products (here excluding cosmetics, of which a large part is sold at retail by beauty shops, as well as furniture and equipment) changed as follows over the 1972–82 period:

	1972	*1976*	*1982*
Total	100	100	100
Permanents	17	20	34
Hair color	35	28	22
Shampoo	15	18	18
Conditioners	13	16	17
Hair goods and accessories	11	3	1
Held-held electrical appliances	10	15	9

[11] In a recent pricing sample of the Consumer Price Index, styling figured in one-third of all haircuts performed in barber shops.

[22] Information from Beauty and Barber Supply Institute. See also the advertiscment for Oster Corp., and Wahl Clipper Corp., in various issues of *Modern Beauty Shop* and *Modern Salon*.

[23] Information from National Beauty and Barber Manufacturers Association. See also advertisements of Styling Research Co. in *Modern Salon*, November 1982, and Duhl, Duck Inc., *Modern Salon*, April 1984.

[24] *Ibid*. See also advertisements for shears, switch blades, and razors, for example, by Jatai International, Los Angeles, CA, in *Modern Salon*, September 1984.

[25] Apparently none of the pertinent advertisements have claimed that labor time savings would result from the use of the products advertised. Industry observers, however, say that the use of better service-adapted styling tools is considerably less tiring than the use of more conventional tools—considering that the stylist stands behind the chair a good part of the day and moves her or his arms in a distal position.

APPENDIX: Measurement techniques and limitations

Indexes of output per hour of all persons measure the change in the relation between the output of an industry and the hours expended on that output. An index of output per hour is derived by dividing an index of output by an index of hours.

The preferred output index for personal service industries would be obtained from data on the quantities of services provided by the industry. The quantity of each type of service provided would be weighted (multiplied) by the time required to provide one unit of each type of service in some specified base period. Thus, services that require more labor time would be given more importance in the output index than services that require less.

Such data, however, are not available for the beauty and barber shop industries. Real output of these industries was estimated by removing the effects of changing prices from the current-dollar value of industry receipts. Because an adjustment for price changes usually lowers the dollar value, such a series is referred to as a deflated value measure. The deflator used here is the Consumer Price Index for beauty shops and for barber shops. These two CPI's price a total of 25 types of service and 51 specific services, as well as certain additional pricing factors. The more important the service, the greater the probability of its being priced.

The index of hours for beauty and barber shops is for all persons—that is, the index represents hours for paid employees, as well as for partners and proprietors. As in all of the output-per-hour measures published by the Bureau of Labor Statistics, hours and employment are considered homogeneous and additive. Adequate information for weighting the various types of labor separately are not available.

The indexes of output per hour do not measure the specific contribution of labor, capital, or any other single factor. Rather, they reflect many interrelated influences such as changes in technology, capital investment, design and layout of workplaces, skill and effort of the work force, and managerial ability.

The output measure is derived from data on annual receipts published by the Bureau of the Census. The all-persons-hour measures are derived from data on employment and hours originated by the Bureau of Labor Statistics and supplemented by data reported by the Internal Revenue Service, and from special tabulations compiled for the Bureau of Labor Statistics by the Bureau of the Census.

Productivity in the metal doors, sash, and trim industry

The overall rate of output per hour increased slowly from 1967 to 1983, reflecting low output growth and an increase in employee hours; moderate advancement is expected to continue

ELMER S. PERSIGEHL AND JOHN G. OLSEN

From 1967 to 1983, output per hour in the metal doors, sash, and trim industry[1] increased at an average annual rate of 0.9 percent. In comparison, the rate of productivity growth for all manufacturing industries during this period was 2.4 percent. The slow productivity rise reflected a relatively low output growth of 1.5 percent per year and an increase in employee hours of 0.6 percent per year. (See table 1.) The industry's demand is dependent upon residential and nonresidential building construction, where wide seasonal and cyclical fluctuations have been common. The productivity growth experienced in this industry has been aided by gradual improvements in equipment design and the increased application of easier-to-use aluminum materials.

Year-to-year changes in industry output and productivity have generally shown similar movements. Large increases in output have been associated with above average gains in productivity. For example, in 1971, output increased 11.3 percent and productivity jumped 11.3 percent. Similarly, output advanced 11.4 and 24.7 percent in 1976 and 1977, while productivity gained 4.0 and 7.6 percent. In 4 of the 6 years that output declined, productivity also fell. Despite declines in output during 1975 and 1982, productivity advanced as manufacturers were able to adjust their work force hours to meet demand changes.

Subperiod productivity trends

In the metal doors, sash, and trim industry, productivity growth can be divided into two distinct periods: 1967–72 and 1972–83. From 1967 to 1972, productivity grew at a rate of 2.4 percent per year based on a gain in output at a 3.8-percent rate and an increase in hours at a 1.4-percent rate. This growth, however, reflected a slight decrease during 1967–70, with a substantial growth in 1970–72 of 6.5 percent per year. Following the economic recession of 1970, industry output grew strongly in 1971 and 1972.

Between 1972 and 1983, productivity increased at the low rate of 0.5 percent per year, reflecting an annual output growth of 1.2 percent and an increase in hours of 0.7 percent per year. This slow growth resulted from a balancing off of diverse movements. From 1972 to 1974, productivity fell at an average annual rate of 3.2 percent, but from 1975 to 1977 it rose to a rate of 5.8 percent as a result of an average increase in output of almost 18 percent per year. From 1977 to 1981, productivity again declined at a rate of 2.4 percent per year, largely as a result of the economic recession in 1980. But it rebounded in 1982 and 1983, increasing at an annual rate of 4.6 percent.

Output

Establishments in this industry manufacture metal and metal covered doors and sash, window and door frames, screens, molding, and trim. In 1983, more than two-fifths of the industry's output consisted of doors, including garage

---

Elmer S. Persigehl and John G. Olsen are economists in the Division of Industry Productivity and Technology Studies, Bureau of Labor Statistics.

doors, and around one-third of window units and related items. The industry's output depends closely on building construction markets. More than four-fifths of the output was used in building construction.[2] Approximately two-fifths of output was used in new residential housing, including additions and alterations. One-sixth was used in new nonresidential buildings, which include educational and commercial buildings. Additionally, almost one-quarter of output was used in maintenance and repair construction on existing buildings.

In spite of several economic downturns, overall output of the metal doors, sash, and trim industry increased an average of 1.5 percent per year between 1967 and 1983. In comparison, over the same period, all manufacturing output increased an average of 2.3 percent per year.

The industry's output generally paralleled the trend for new building construction.[3] Between 1967 and 1972, for example, the industry's output grew at an average annual rate of 3.8 percent. In comparison, the deflated value of new building construction put in place increased 3.6 percent annually over this period. From 1972 to 1975, the industry's output fell 10.6 percent per year as the market for new buildings experienced an 11.0-percent annual decline.

Since the mid-1970's, this pattern has changed somewhat. To offset market fluctuations in new building construction, manufacturers have produced more of their output for the replacement market. In 1973, new construction accounted for about 52 percent of the value of total industry revenues.[4] By 1983, this market had fallen to about 40 percent of revenues. The replacement market comprised about 59 percent of revenues in 1983, rising from 46 percent in 1973. This trend is expected to continue.

Metal doors. One factor affecting the demand for industry output has been the wider use of metal doors. In single family housing construction, homebuilders are installing more metal than wooden doors in projects costing less than $100,000.[5] According to the Architectural Aluminum Manufacturers Association (AAMA), aluminum doors accounted for more than three-fourths of all residential patio doors used in 1982. The introduction of more energy efficient metal door units along with increased consumer demand for security and fire safety, also has contributed to a shift in the type of entry door in new construction from wood to metal.

Demand for garage doors, particularly by the metal buildings industry, has grown substantially in the past 20 years. Before 1966, only 5 percent of all overhead garage doors were manufactured out of metal.[6] Technological advances such as the development of prepainted doors, which have eliminated the need for on-site painting, and new insulating core materials, along with improved economies of scale, which have lowered average unit costs, have led to increased demand for metal doors. By 1980, about 90 percent of the doors installed on steel buildings were made of galvanized steel.

Aluminum windows. Another factor contributing to the growth of industry output has been the increasing penetration of the new housing market by manufacturers of aluminum windows. In 1967, aluminum and, to a small extent, steel windows accounted for about 55 percent of all new residential window installations, with wood making up the other 45 percent.[7] Except for 2 years in the mid-1970's when aluminum window prices rose relative to wooden ones, the industry's share of the window market has grown steadily to approximately 70 percent of the total in 1980.

Demand for metal windows varies from region to region and by type of building. Aluminum windows are more popular in the South and parts of the West, while wood windows are more popular in the Northeast and North Central parts of the United States. Among residential units, the use of aluminum windows is more prevalent in attached single family houses and apartments than in detached single family homes. Between 1977 and 1983, about 71 percent of new private housing starts occurred in the South and West regions. During this period, townhouses and apartments also increased their share of the new housing market. As a result, manufacturers of aluminum windows increased their share of new residential construction.

Storm windows and doors. The vast majority of storm windows and doors are made of aluminum. According to AAMA statistics, aluminum units comprised almost 95 percent of all storm windows and doors shipped from 1970 to 1983. Beginning in the mid-1970's, shipments increased substantially because of rising heating and cooling costs and energy tax credit incentives. Several years of high installation rates reduced the number of homes containing only single glazed windows that were available for storm window

Table 1. Productivity and related indexes for metal doors, sash, and trim, 1967–83

[1977 = 100]

Year	Output per employee-hour	Output	All employee hours	Employees
1967	81.7	81.0	99.1	97.1
1968	85.6	81.7	95.4	94.8
1969	83.7	81.9	97.9	96.4
1970	82.1	79.5	96.8	94.7

1978–83	0.9	−0.3	−1.2	−1.0

and door applications. This temporary market saturation along with a fall in new housing starts contributed to a total decline in product shipments of 53 percent from 1978 to 1982.

Insulated doors and windows. Since the mid-1970's, much progress has been made in the energy efficiency of door, window, and wall design. According to the Insulated Steel Door Institute, advancements in weatherstrip systems and improvements in insulating technologies for door sections has led to a reduction in heat loss of more than 40 percent. In glass areas of buildings, the best improvement has been achieved by using double glazed insulating glass. In many cases, heat loss through glass areas has been cut in half. The use of better seals and coated glass also has improved the energy efficiency of windows. These product improvements along with home energy conservation incentive programs contributed to an increase in the replacement and retrofitting of existing doors and windows with more energy efficient units. Replacement and remodeling activity has helped to sustain the industry's output by offsetting the impact of declining new building construction.

Employment

Total employment in the metal doors, sash, and trim industry grew at a rate of 0.7 percent per year between 1967 and 1983. In comparison, all manufacturing industries showed no average annual change in employment over the same period. Employment growth for the industry was uneven, however, rising from 63,900 in 1967 to 70,700 in 1972, declining to 53,700 in 1975, again rising to a peak of 73,300 in 1979, and then declining again to 66,300 in 1982. The proportion of production workers fell from 75.0 percent in 1967 to 73.8 percent in 1983.

The majority of jobs in the metal doors, sash, and trim industry consisted of stamping, blanking, and forming of metals. Almost 50 percent of the production workers were engaged in these three operations.[8] Other main types of work in this industry consist of galvanizing iron and steel, painting, lacquering, or enameling. About 15 percent of the employees worked in these finishing occupations. About 11 percent worked in a tool and die shop. Eleven percent worked in plate or structural fabrication. About 9 percent worked in a machine shop. The remaining 8.5 percent of production workers were engaged in electroplating, heat treating, or worked in the pattern shop.

Female employees constitute an increasing proportion of the workers in the metal doors, sash, and trim industry, rising from an 18-percent share of the work force in 1967 to almost 27 percent of all industry employees in 1983.[9] During the period, average weekly hours of production workers declined 1 hour, from 40.6 hours in 1967 to 39.6 in 1983.

Capital expenditures

Increases in capital expenditures are important and frequently contribute to advances in output per hour. During the 1967–83 period, the annual rate of growth in new capital expenditures per employee averaged 9.2 percent in the metal doors, sash, and trim industry. In comparison, the average for all manufacturing establishments was 10.0 percent. Although the growth rate was close to the average, the level of capital expenditures per employee in this industry was less than half the level for all manufacturing industries. In 1983, the industry spent about $1,350 per employee for new capital expenditures, compared with more than $3,500 for all manufacturing. During 1983, the metal doors, sash, and trim industry allocated around 70 percent of capital expenditures to the purchase of new machinery and equipment. In comparison, the average for all manufacturing during 1981 (most recent year for which data is available) was more than 80 percent. The remainder was expended on new structures and plant additions.

Size of establishments

In 1982, the Bureau of the Census reported a total of 1,738 establishments in the metal doors, sash, and trim industry. A small percentage of these accounted for the majority of industry shipments. Nearly 10 percent of the industry's establishments averaged more than 100 employees and generated approximately 57 percent of the industry's value of shipments. In contrast, more than one-quarter of the establishments reported four or fewer employees and accounted for only 1 percent of shipments.

The number of metal window manufacturers has increased substantially during the past 20 years. Currently, about 750 companies make prime metal windows, and 175 firms manufacture metal storm windows.[10] Although some large firms manufacture metal windows and doors in several establishments, most producers are small, one-plant companies that serve local or regional markets.

Metal windows usually are manufactured in a variety of custom-ordered sizes. To be responsive to special orders, manufacturers of windows generally are located near their market outlets. In 1977, the majority of metal window frames and sash produced was shipped less than 200 miles from the manufacturers' plants to their customers.

Technology

Technological change in this industry during recent years has primarily consisted of modifications and improvements in existing methods and equipment.

The manufacture of aluminum framing members for window and curtain walls essentially consists of the remelting, extruding, annodizing, and fabricating of aluminum to specified dimensions. Aluminum scrap is remelted in an aluminum cast house to produce aluminum billets. To produce extruded shapes, a hydraulically operated ram forces a hot (but not molten) aluminum billet through openings in a precision-made die. The result is a fine grained extrusion conforming to the configurations and dimensions of the die. In this process, it is possible to form an infinite variety of uniform products.

Anodizing is a protective treatment used to improve the corrosive and abrasive resistance of aluminum. This treatment does not apply a coating but converts a thin layer of aluminum on the surface to an oxide that is extremely hard. In recent years, anodizing processes have been developed that result in anodic films in amber shades, ranging from light to dark. In many cases, amber colored finishes have been used in architectural work in place of clear anodizing. Anodic films developed with these processes are much harder, denser, and longer lasting than former clear anodizing finishes. Another recent modification at one plant replaced a one-step, 19 bath anodizing process with a two-step, 18–20 bath process. The two-step process which uses better controls has improved the quality of the aluminum oxide coating, and reduced energy and labor requirements for this operation.

The anodized aluminum extrusions are fitted and assembled in the factory to modular or custom sizes. The joints in aluminum windows and frames are either welded or fastened mechanically. Mortise and tenon joints, that is, joints between members at right angles to each other, are commonly used. The clip, epoxy, and stake (CES) method is often used when joints are fastened together mechanically. The clip, a type of corner fastener, is placed into the joint with epoxy. Then a machine mechanically drives the extruded sections together.

Although not widely diffused in the industry, the computer-aided design and computer-aided manufacture (CAD/CAM) system have been introduced into the operations of some plants. This technology uses computers to assist in developing designs for products to be manufactured. It is most feasible for large plants which have a sizable volume of fabricating work, generally destined for the commercial building sector. The CAD/CAM system has improved design analysis and cut unit labor requirements for skilled drafters through its greater sophistication, accuracy, and operation speed.

A recent equipment improvement has been the introduction of programmable controllers into new machines that perform complex operations. These electrical testing devices that replace limit switches allow the source of electrical problems to be more easily located, thereby reducing machine downtime. Another equipment improvement has been the development of drilling machines that drill holes of different configurations. Compared with previously used equipment, these machines reduce set up time, and thus, lower unit labor requirements.

Outlook

As indicated earlier, short-term changes in productivity generally reflect changes in output and output in this industry is directly related to trends in residential and nonresidential building construction. According to macroeconomic projections by the U.S. Department of Commerce, building construction should continue to grow during the next 5 years. Private nonresidential construction is expected to increase in quantity and value put in place. The number of residential units built is expected to level off. Because of increases in the average size per unit, however, the value of residential construction put in place is expected to grow slightly. Based on these projections, the demand for the metal doors, sash, and trim industry's products should also rise during the next 5 years. This projection, along with the experience over the 1967–83 period, suggests that productivity should continue to advance moderately. Wider adoption of recent innovations, particularly among large manufacturers, should also contribute to the growth of labor productivity. ☐

APPENDIX: Measurement techniques and limitations

The productivity indexes in this study measure the change over time in industry output per unit of labor input. They do not measure the specific contribution of labor, but reflect the influence of many factors such as technology, capital investment, and managerial skills, as well as the skill and effort of the work force.

The output index is based on value of shipments data adjusted for inventory change, published by the Bureau of the Census. Detailed data from the Census of Manufactures for 1967, 1972, 1977, and 1982 were used to derive benchmark indexes, to which the annual indexes for intervening years, based on the Annual Survey of Manufactures, were adjusted. The value of shipments of the various product classes were adjusted for price changes by appropriate Producer Price Indexes to derive a real output measure. These, in turn, were combined with employee hour weights to derive the overall output measure. Employment and employee hour indexes were derived from census data. Employees and employee hours are considered homogeneous and additive, and thus do not reflect changes in the qualitative aspects of labor, such as skill and experience of persons constituting the aggregate.

Data on the quantities of goods produced by the metal doors, sash, and trim industry are not complete. Real output, therefore, was estimated on the basis of a deflated value technique. That is, changes in the price levels of the current dollar value of production were removed by means of appropriate price indexes. Because an adjustment for changing price levels usually lowers the dollar value, such a series is referred to as a deflated value measure. In an industry such as the metal doors, sash, and trim industry, where the raw material may differ from one product to the next, this technique may result in some bias in the measure. However, the bias is minimal.

To combine segments of the output measure, employee hour weights relating to the individual segments were used. This technique was used at various levels of subaggregation for the variety of products manufactured by this industry. These procedures result in a final output index that is conceptually close to the preferred output measure.

Indexes of output per employee-hour relate total output to one input of labor time. The indexes do not measure the specific contribution of labor, capital, and any other single factor. Rather, they reflect the joint effects of such factors as changes in technology, capital investment, capacity utilization, shop design and layout, skill and effort of the work force, managerial ability, and labor-management relations.

Verifying basic skills

Employers report in survey after survey that what they are seeking in young empoyees is, first, the basic skills needed to learn on the job, and, second, the dependability and world-of-work skills to show up on time and follow instructions. Vocational skills are less frequently required, although important for some jobs such as secretarial work. Employers do not usually give academic or other tests, and have little basis for judging the dependability of those with limited work experience, so they judge on the basis of academic credentials and other considerations such a vouching by acquaintances or relatives, best bets based on previous experiences with similar individuals, or prejudice. Employment and training programs recruit and serve those unable to secure jobs in the private sector. Unless these enrollees attain academic credentials recognized by employers, or are sorted so that those who prove to be dependable and trainable are identified, participants who are disadvantaged at entry will be equally disadvantaged at exit.

Research Summaries

Minimum wage stability affects shirt and nightwear industry pay

Absence of change in the Federal minimum wage during the May 1981–84 survey period helps to explain the relatively modest wage gains of production and related workers in the men's and boy's shirts and nightwear manufacturing industry. Straight-time earnings averaged $4.68 an hour in May 1984, according to the latest Bureau of Labor Statistics survey.[1] This was 11 percent above the $4.23 recorded in a similar survey conducted in May 1981—an increase averaging 3.4 percent a year.[2] By comparison, wages and salaries in all nondurable goods manufacturing as reported by the Bureau's Employment Cost Index rose 17.1 percent, or 5.4 percent a year, during the 3 years ending in the second quarter of 1984.

In establishments employing about half of the industry's production workers in May 1984, pay was linked to the minimum wage by a policy of adjusting wage rates for all jobs to reflect changes in the statutory minimum. (See table 1.)

A more moderate rate of inflation between May 1981 and May 1984 also helps to explain the shirt industry's pace of wage increases. The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) rose 13.5 percent, or 4.3 percent a year, at a time when one-fifth of the shirt workers were under collective bargaining agreements providing for cost-of-living wage adjustments.

Workers in the Southeast, who accounted for seven-tenths of the production work force, averaged $4.62 an hour in May 1984. Among the other five regions studied separately,[3] average hourly earnings were highest in New England ($5.43) and lowest in the Southwest ($4.17).

Hourly earnings of more than 64,000 workers covered by the study ranged from the minimum wage of $3.35 to $9 and over. The middle 50 percent of the workers earned between $3.68 and $5.42 an hour. About 14 percent of the workers earned within 5 cents of the Federal minimum wage, down from 22 percent in 1981.

Among the 23 occupational classifications selected to represent the shirtmaking process, average hourly earnings ranged from $7.49 for sewing-machine adjusters to $4.03 for thread trimmers. Machine cutters ($6.18) and markers ($5.57) were the only other jobs studied separately with hourly averages over $5.50. Sewing-machine operators, by far the largest occupational group studied, with nearly 37,000 workers, averaged $4.59 an hour. Averages for the other jobs with more than 2,000 workers were $4.66 for combination final inspectors and thread trimmers, $4.62 for garment folders, and $4.48 for finish pressers.

Occupational pay levels varied widely by region. While pay levels typically exceeded the national averages by 15 to 25 percent in New England and by 5 to 15 percent in the Border States and Middle Atlantic States, occupational averages in the Southeast and Pacific generally fell slightly below the national levels, and those in the Southwest were usually 10 to 20 percent below. Regional pay patterns, however, were not consistent among individual jobs. For example, shipping clerks in the Border States averaged 48 percent more than those in the Southwest, but clicker-machine operators (who cut or stamp small pieces of various shapes from material or cardboard) in the latter region averaged 9 percent more than those in the Border States.

Occupational pay levels were generally higher in metropolitan than in nonmetropolitan areas, in plants with at least 250 employees than in smaller establishments, in union plants than in nonunion plants, and in establishments primarily making dress shirts than in those principally making sport shirts.

Extensive use of incentive pay plans, notably piece rate systems, contributed to wide ranges of rates within an occupation and area. Incentive earnings vary according to work experience, effort, work flow, and other factors which the worker may or may not control. Workers paid under incentive systems, four-fifths of the production workers, usually averaged from 10 to 15 percent more than time-rated workers in the same occupation. Incentive workers accounted for virtually all of the sewing-machine operators and were also predominant among the other sewing and finishing occupations. Workers paid on a time-rated basis, however, were predominant among sewing-machine adjusters, janitors, shipping clerks, and work distributors.

Virtually all production workers were in establishments with formal provisions for paid holidays and vacations. Three-fifths of the workers received 5 to 8 holidays annually; while nearly three-tenths—mainly workers under contracts negotiated by the Amalgamated Clothing and Textile

Workers Union (ACTWU)—were entitled to 10 holidays. Vacation plans in the industry typically provided 1 week of pay after 1 year of service, 2 or more weeks' pay after 3 years of service, and 3 weeks after 10 years. About one-fifth of the workers could receive 3 weeks after 1 year of service. Most of these workers were in plants covered by the ACTWU plan, which provides for a 2-week summer vacation for employees with 1 year of service (1 week after 6 months) and a 1-week winter vacation for employees with 1 year of service.

Life, hospitalization, and surgical insurance were provided for about nine-tenths of the workers. At least three-fifths of the workers were covered by accidental death and dismemberment insurance and basic medical and major medical plans. Slightly more than one-half were included in private pension plans, nearly all of which were paid for entirely by the employer. Paid funeral leave was available to seven-tenths of the workers and jury-duty pay to nearly three-fifths.

The study included establishments engaged primarily in manufacturing men's, youth's, and boys' shirts (including polo and sport shirts) and nightwear, cut and sewn from purchased woven or knit fabric. In May 1984, establishments within the scope of the survey—those with 20 workers or more—employed 64,789 production workers. This is almost exactly the same number of workers reported in 1981 and breaks a pattern of decline reported in similar BLS studies since 1964. In 1984, about one-half of the production workers were in establishments primarily making sport shirts. Plants making dress shirts accounted for just under two-fifths of the work force.

In addition to the six major regions studied, separate data were obtained for nine States and three local areas. These localities employed slightly more than four-fifths of the industry's production workers. Among the States, employment ranged from 10,500 in North Carolina to about 600 in Maryland.

The Bureau's eight regional offices will provide free of charge, while the supply lasts, separate releases issued earlier for the following States and areas: Alabama; Georgia; Maryland; Mississippi; North Carolina; Pennsylvania; South Carolina; Tennessee; Virginia; Allentown–Bethlehem–Easton, PA-NJ; Los Angeles–Long Beach, CA; and Pottsville–Shamokin, PA. A comprehensive bulletin, *Industry Wage Survey: Men's and Boys' Shirts and Nightwear, May 1984*, Bulletin 2232, is for sale by the Superintendent of Documents, Washington 20402.

Table 1. Average hourly earnings and percent change in men's and boy's shirts and nightwear and Federal minimum wage levels, selected years, 1964–84

Survey date	Average hourly earnings		Federal minimum	
	Level	Percent change[1]	Level	Percent change[1]
May 1984	$4.68	11	$3.35	0
May 1981	4.23	29	3.35	26
May 1978	3.28	29	2.65	32.5
June 1974	2.54	24	2.00	25
October 1971 ..	2.05	12	1.60	0

Expert panel offers suggestions on 1990 census methodology

Pursuant to a 1982 recommendation by the American Statistical Association, the Committee on National Statistics of the National Research Council established a panel under the aegis of the Census Bureau to make recommendations on methodology for the 1990 decennial census. Formally designated the Panel on Decennial Census Methodology, this group of experts was charged with suggesting research, experiments, and new methods and with guiding the Census Bureau in evaluating alternative techniques. Their work continued the longstanding policy of evaluating the results of the most recent census with a view toward resolving problems and testing new procedures well before the next census is undertaken.

The final report of the panel, *The Bicentennial Census: New Directions for Metholodogy in 1990*, was published in 1985. The 404-page volume first examines the history of the decennial census, noting particularly the great expansion in usage of census data since the first national study was conducted in 1790 and concommitant growth in numbers of criticisms of census procedures and results. Against this background, the authors present an analysis of existing problems with census methodology and propose solutions.

The major issues confronted in the most recent round of methodology review involved: (1) the proper adjustment of census counts and characteristics; (2) the appropriateness of sampling techniques within a census framework; and (3) the possible use of administrative records to improve the accuracy of census counts and the efficiency of census operations. In developing its recommendations, the panel considered the stated goal of the Census Bureau to develop better and more timely estimates for 1990 without an appreciable increase in per-housing-unit costs over 1980 levels. Following are selected recommendations from the final report:

- That the Census Bureau assess the need for a mid-decade census, particularly by studying the effect of errors in postcensal population estimates compared with errors in the decennial census on major data uses. Unless these studies do not support the value of a mid-decade census, the Bureau should make every effort to secure funding for a census in 1995.
- That the Bureau prune its proposed research and testing program for 1986 by deferring certain projects until 1987 or later and by forgoing research on proposals that are unlikely to be implemented in the 1990 study or that appear to hold little promise based on previous census experience or other survey research results. Other cutbacks might be accomplished by making fuller use of 1980 census data and experimental results. To this end, the Bureau should assign a high priority to the completion of 1980 census methodology studies and further analysis of 1980 data.
- That the Bureau assign a high priority to the completion of studies of undercount and overcount of various population groups in the 1980 census. A variety of question designs for sensitive race and ethnicity information should be tested for the 1990 study, including some that combine the collection of information on Hispanic origin with other race and ethnicity information. The report also recommends that the Census Bureau, the National Center for Health Statistics, and other Federal agencies work closely together to design questions and response editing rules on race and ethnicity that minimize conceptual differences between census and vital statistics records.
- That the Census Bureau not pursue research on or testing of a sample survey as a replacement for complete enumeration in 1990. This recommendation reflects the panel's belief that a large sample survey would result in less complete coverage than a census, and that there would be only minor cost savings in sampling on the scale necessary for satisfaction of present demands for small-area data from the census. However, the Bureau should include in its 1987 pretest program the testing of sampling for the follow-up of households that do not return their questionaires. Sampling could prove cost-effective in the final stages of follow-up, where it becomes very expensive to count an additional person.
- Given the likelihood that the census will continue to produce different rates of undercoverage for various population groups, it is recommended that work proceed on the development of adjustment procedures and that adjustment be implemented if there is reasonable confidence that it will reduce differential coverage errors. The Census Bureau should also explore methods for providing estimates of errors associated with estimates of census over- and undercoverage, with a view to publishing such error estimates along with coverage evaluation results and any adjusted census data that may be issued.
- That the Census Bureau conduct research and testing in the area of improved accuracy of responses to content items (income, utility costs, and so forth) in the census. Further, the content improvement procedures examined should not be limited to reinterviews of samples of respondents, but should also include the use of administrative records. A specific recommendation urges the Bureau to investigate the cost and feasibility of obtaining data on housing structure items through alternative uses of local administrative records.

Copies of the full report of the Panel on Decennial Census Methodology, edited by Constance F. Citro and Michael L. Cohen, may be purchased from the National Academy Press, Washington, DC. Price: $23.95. ☐

Foreign Labor Developments

International experiences with technological change

STEVEN DEUTSCH

Most industrial nations are concerned with the impact of microelectronics and technological change on the work force. In many instances, reports from national commissions, such as the Canadian Task Force on Microelectronics and Employment and the Swedish Computer Commission, have attempted to identify and address problems that can arise when new technology is introduced. These reports often lead to legislative solutions to the problems of new technology that are consistent with the larger role played by government in many countries in shaping the conditions at the workplace and the role of labor and management.

In countries with collective bargaining systems similar to the United States, there is evidence of growing reliance on some governmental mechanisms. For example, the Canadian Task Force on Microelectronics and Employment suggested the establishment of mandatory labor-management technology committees in all places of employment with more than 50 employees. These committees would "deal with issues such as training, retraining, redundancy, work-sharing, productivity improvements, and other matters related to technological change at the workplace."[1] A review of the pattern in most industrial nations reveals varying blends of governmental legislation and collectively bargained labor-management agreements.[2]

This reflects not only the tendency to involve government in labor-management relations, but also the relative size of the unionized labor force and the power of labor political parties. The percentage of the labor force which is unionized varies considerably among industrialized nations: United States, 22 percent; France, 28 percent; Japan, 33 percent; Germany, 42 percent; United Kingdom, 55 percent; Australia, 56 percent; Belgium, 79 percent; and Sweden, 83 percent.[3] Most of these nations have a labor party which tends to wed collective bargaining strategies to political and legislative agendas. For example, the Swedish Labor Federation, through the Social Democratic Party, has been successful in gaining governmental approval for legislative changes concerning job security, labor market policies (including advance notification and government subsidies to assure full employment), worker representation on corporate boards, joint consultation between management and labor (co-determination), empowering workers to improve work environments, and the establishment of wage earner funds to give workers gradual ownership and economic influence in the enterprise.[4]

There are many variations in the relative importance of collective bargaining versus legislative approaches, but even in England, Canada, or Australia, where there are strong traditions of deferral to bargaining, in recent years, the government has been active on issues of worker participation and technology.[5]

Adversarial relations

England. Concern with technology was already well developed in England in the 1970's, prior to the resurgence of interest in the United States. Primarily, union-initiated proposed technology agreements with employers dealt with the basic questions of advance notification, job security, training and retraining, worker involvement in technological change, and design and implementation. However, "while unions in Britain have generally recognized the need to extend the scope of collective bargaining in order to influence the introduction of new technology, few have succeeded in achieving this end."[6] The reason for this lies largely in the tension over the short-term strategy of worker involvement in planning. In 1982, a group at the University of Aston examined a large number of English technology agreements and collective bargaining contracts; they concluded that, "To date, it is the defensive/reaction strategy that has predominated."[7]

Compounding the problem today are the troubled economic situation in Britain and the deterioration of labor relations in that country. High unemployment and bitter labor-management disputes overshadow cooperative developments and the substantial number of successfully negotiated agreements which provide for joint efforts and worker involvement in the change process. While the language in many of the agreements is suggestive of what should be implemented, such agreements will work best in a full

employment economy and one in which the spirit of cooperation prevails—features both lacking in England today.

Australia. The Australian situation has paralleled that in many other industrial countries. In 1980, the government established the Committee of Inquiry into Technological Change in Australia. The committee made proposals to reform aspects of Australia's industrial relations system in such a way as to provide incentives for unions and employees to cooperate with employers in the introduction of technological change. However, the reality since has failed to see these fully materialize. The overall picture is characterized by leading industrial relations analysts in Australia:

> . . . although governments, employees and unions have agreed about the need to introduce technological change without causing undue social and economic hardship, this consensus appears to have had little impact on the manner in which changes have been implemented. The majority of employers have introduced new technology without consulting their employees in advance; most unions have been ill-equipped or unprepared to assume a more assertive or interventionist role; and industrial tribunals, by and large, have been unwilling to interfere with managerial rights or prerogatives in this field. These factors have exacerbated conflict in the workplace as, in many cases, traditional patterns of work have been upset, wage relativities have been disturbed and job security has been decreased.[8]

As in the case of England, Australia has had a number of negotiated technology agreements on the primary issues of job security, work organization, work environment, and methods of work involvement. The Australian Council of Trade Unions, just as the Trades Union Congress in England, has passed official statements on technology, disseminated model contract clauses for unions, and conducted technology training for its membership. Nevertheless, the conclusion stated above illustrates the reason for the gap between the ideal and actual practice.

Canada. The U.S. industrial relations system shares some features with those of England, Australia, and Canada. These are traditions which have created a decentralized union structure with a large number of separate unions and individual negotiating situations. It is a system dependent on free collective bargaining with modest governmental intervention outside broad framework laws, and an ideology which tends to emphasize traditional managerial prerogatives and conflicts of interest between management and labor. Canada's experience is especially relevant for the United States because of geographical proximity, the role of U.S. firms in the Canadian economy, and the linked bargaining across the border (international unions in this country typically include Canadian affiliates).

Provincial laws on work environment have been patterned, in part, after Scandinavian models. For example, joint labor-management health and safety committees were mandatory in Saskatchewan in the 1970's, during which a climate of worker participation was cultivated.

In the Canadian Postal Service, where labor relations have been erratic in recent years, the following agreement over technological change notification was negotiated:

> . . . the Employer agrees to notify the Union as far as possible in advance of his intention and to update the information provided as new developments arise and modifications are made . . . the Employer shall provide the Union, at least 120 days before the introduction of a technological change, with a detailed description of the project it intends to carry out, disclosing all foreseeable effects and repercussions on employees.[9]

A 1-year minimum advance notice currently is specified in the contract negotiated by Saskatchewan Telephone and Communication Workers of Canada, with a range of other time periods given in various contracts. Following notice by the employer to the union, the next step defines the role the union and workers will take in decisions affecting technological change. Many contracts spell out the establishment of joint labor-management committees to consult, plan, and execute programs of technological change, including issues of relocation and retraining of workers. Recently, the National Association of Broadcasting Corporation agreed that, "No employee who has completed his probationary period as of the date of execution of this Agreement will be laid off or suffer a reduction in salary during the term of this Agreement because of the introduction of new or modified equipment and/or associated changes in methods of operation."[10]

Involvement of the work force in the design and implementation of new technology has been a significant part of the Canadian labor relations scene in recent years, especially in the case of office automation and video display terminals (VDT's). The Canadian Union of Public Employees and the United Way of the Lower Mainland, British Columbia, have a contract which stipulates:

> The selection and installation of equipment shall be done in consultation with the affected employees. The installation shall also involve consultation directed towards assuring that all 'ergonomic' factors are dealt with satisfactorily.[11]

The Newspaper Guild Local 115 and Suburban Press, Ltd., have a memorandum of agreement which states that "If an employee has been operating a VDT in the final two hours of a shift, the employee shall not be required to operate a VDT less than 30 minutes before leaving the plant."[12] Other provisions in this agreement deal with inspecting each VDT for radiation emmissions. Several Canadian labor agreements, including those which cover the Newspaper Guild and Communications Workers, specify that women workers during pregnancy may have the option of being rotated onto a non-VDT job. This last provision is controversial because scientific data have not conclusively demonstrated danger during pregnancy caused by working on a VDT. However, the concern has been pushed by workers and some of the Canadian unions who have won such agreements from employers. An equivalent level of concern exists in the United States and a similar provision for pregnant women is being pursued in some contract negotiations.

European Community: joint efforts

There are considerable variations in the pattern of labor relations abroad. Nations in the European Community have agreed to some coordinated policies which have influenced various aspects of cooperation, including sharing corporate economic data with the workers, and worker and union involvement in work organization decisionmaking. As of 1984, the European Community is ". . . examining with both sides of industry the best way and at what level to introduce basic principles on the information and consultation of workers affected by the introduction of new technologies, while taking account of practices and procedures already applied in the Member States."[13]

In the past, many European unions have been more aggressive than those in the United States; this is particularly true for the issues of advance notification, joint participation in workplace design and the introduction of new technology, protection of jobs and programs for relocation, retraining, and other means of cushioning the effects of job loss.[14] At the same time, the industrial relations climate in much of Europe has been supportive of some participative and joint labor-management approaches to addressing issues of technological change. Both management and labor have generally agreed that the new technology offers an excellent opportunity for work redesign so as to eliminate boredom and monotony and facilitate the creation of semi-autonomous work groups with greater worker influence. "The technology-optimistic attitude, which was distinctive of the years of prosperity up through the sixties, could be found in all European countries; technology was unequivocally seen as a, and often the most important, remedy for securing full employment and greater welfare for union members."[15] The economic crisis of the later 1970's and early 1980's has altered some of the earlier optimistic viewpoints and a more recent opinion suggests that, "There is considerable evidence that automation has outpaced the ability of managements and trade unions to control, much less to optimize, its [technology's] implications for quality of work life, at least for very large numbers of enterprises."[16]

A recent OECD study revealed: "A common theme of many of the reports is that new technology can yield great benefits. The question, who receives the benefits and who carries the burden of the costs?"[17] The report then presents as a possible model the Norwegian Data Agreement which provides for workers affected by the new information technology to be informed and consulted.

Historically cooperative relations

Norway and Sweden. The Norwegian developments are seen as an integration of the legislative approach to improve the work environment and the negotiation process involving unions and employers to implement particular means whereby workers and their representatives have authentic influence over the introduction of new technology and work organization.[18] Parts of Section 12 of the 1977 Norwegian Work Environment Act are very informative:

- *General requirements.* Technology, organization of the work, working hours and wage systems shall be set up so that the employees are not exposed to undesirable physical or mental strain and so that their possibilities of displaying caution and observing safety measures are not impaired.

  Conditions shall be arranged so that employees are afforded reasonable opportunity for professional and personal development through their work.
- *Arrangements of work.* The individual employee's opportunity for self-determination and professional responsibility shall be taken into consideration when planning and arranging the work. Efforts shall be made to avoid undiversified, repetitive work and work that is governed by machine or conveyor belt in such a manner that the employees themselves are prevented from varying the speed of the work. Otherwise efforts shall be made to arrange the work so as to provide possibilities for variation and for contact with others, for connection between individual job assignments, and for employees to keep themselves informed about production requirements and results.
- *Control and planning systems.* The employees and their elected union representatives shall be kept informed about the systems employed for planning and effecting the work and about planned changes in such systems. They shall be given the training necessary to enable them to learn these systems, and they shall take part in planning them.[19]

What this language specifies is an obligatory information-sharing process whereby workers cooperate with management in advance of the introduction of significant changes in technology, work organization, and job design. It is predicated on research which indicates that a cooperative approach will indeed continuously improve the work environment. It is a perspective which has had a good deal of impact on the thinking of practitioners and policymakers throughout the world.[20]

It would be a mistake to judge the Norwegian or Swedish approaches as being unqualified successes; however, they are interesting models of how the issues of work organization, technology, and labor-management relations have been addressed. In the Norwegian case, the broad Work Environment Act obliges employers to consult with workers and their representatives and sets up a joint approach to planning. In Norway, with more than a decade of experience, professional computer and technology experts serve as consultants for large unions who are planning a better working environment and actively and competently engage with management in such work-systems development.[21] In Scandinavia, the unions have endorsed the new technologies, but they have actively worked on their own research and development with the aid of outside experts. For example, the Nordic Graphic Arts Workers Union Confederation has been designing a model high tech work environment, using microelectronic graphic arts equipment and computer-aided design. With consultants from the Swedish Center for Working Life and others, they have worked out the best situation from a worker viewpoint, while satisfying managerial and organizational goals of cost effectiveness and productivity.[22] In other instances, Swedish unions, under the 1976 Co-determination Act, have gained an employer commitment to actively involve workers in the planning of new technology systems. For postal social insurance office workers, it was clear from the beginning of the work system design that their concerns, which included the quality of service to the clients with whom they interacted, would be taken into account.[23]

In a 1979 agreement, the Swedish postal workers used the introduction of new technology and work reorganization as a means of improving the work environment. Approximately 4,700 women work in the central post office in Stockholm, and the technological and operational changes initially proposed threatened between 500 and 600 jobs. The union and management agreed on the goals of improved working environment, improved content of work, preserved level of employment, and development of new products and improved service to clients.[24]

In 1982, an "Agreement of Efficiency and Participation" was signed by the Swedish employers' federation (SAF) and the blue-collar (LO) and white-collar (PTK) union federations. It recognized the need for efficiency and productivity if Swedish enterprise was to be more competitive in the international markets; it also detailed some of the means of implementing technological change to achieve these goals. The paragraph dealing with technical development states:

> *Item 1. General direction.* The parties are agreed that day-to-day as well as more far-reaching technical modernization offers many opportunities that must be taken to enable the company to survive, achieve success and therefore also safeguard jobs and employment. Capital expenditure makes it possible to improve productivity as well as creating opportunities to introduce new production systems, utilize modern technology, develop the expertise and skills of employees, and thereby increase the competitiveness of company.
>
> *Item 2. Stimulating work.* In the event of technical change, a sound job content shall be the goal, together with opportunities for the employees to increase their skills and accept responsibility for their work. The knowledge of the employees should be stimulated together with their ability to cooperate with and have contact with their colleagues.
>
> *Item 3. Major changes.* When technical change that involves major changes for the employees is being planned, the trade union organizations shall participate. Such participation shall take place in accordance with the provisions in [sections 7 and 8].
>
> The employer shall describe the considerations underlying the new technology, and the technical, financial/economic, work environmental, and employment consequences that can be foreseen and possibly make proposals for appointing project groups.
>
> *Item 4. Training information.* It is important that the employees are given opportunities for further development of their vocational expertise and skills. The company shall make available as early as possible training for the new jobs that technical change will involve. Such training shall be provided at the expense of the company and on unchanged pay and employment conditions.

According to the authors of the document, "LO, SAF, and PTK are in agreement about the need for increased knowledge and responsibility and the need to support those affected by technological change."[25]

A number of work redesign experiments were initiated in Norway and in Sweden in the late 1960's and early 1970's. Many of these cases have been widely discussed. What is more critical is to see what *post hoc* assessments tell about the patterns of cooperative labor-management relations as applied to changing technology and the workplace. A leading analysis by the Swedish Employers' Federation concludes:

> If we glance quickly at the significant developments of the 1970's, we are struck by the fact that a large part of the evolution of our thinking regarding work organization and job content has arisen in connection with technological changes. In many cases, new organizational principles have scored genuine breakthroughs only when ways have been found to change material flows, machine grouping, work environments and design of factories.
>
> An important explanation of why the demand for better jobs could have such a large concrete effect on production methods in the 1970's is that it is only recently that new demands for job satisfaction and job content could be met with demonstrably superior technical measures. And *it is only when practitioners out in the factories can be involved in these questions that technology can be changed in such a way as to provide new types of work organization and job content* (emphasis added).[26]

The Swedish process is designed to mutually benefit all parties. Swedish workers and unions have supported the application of the most advanced technology; in fact, Sweden leads the world in *per capita* use of robots today.[27] The system has allowed employers to increase efficiency and productivity, and thus helped maintain their competitive role in such world market industries as auto production and finished steel products. Employees have been involved in planning changes in the work environment and have considerable job security and a range of training programs, including those negotiated with employers.

In both Norway and Sweden, broad framework laws, passed by the Federal Government and then subject to local agreement or implementation, have served as the major device for engaging a cooperative approach to technological change by labor and management. Both parties have accepted the desirability of new technology and have decided that solving problems in the work environment and designing and implementing the best system require joint efforts. The differences between Scandanavian and U.S. positions on technology and labor relations are considerable. These distinctions are influenced by the size of the public sector, proportion of the labor force organized into unions, and governmental policies and programs. With particular regard to Sweden, a leading American trade union researcher states:

> . . . one of the distinguishing features is the breadth and depth of the activities in Sweden, involving trade unions, employers and governmental agencies. In the U.S., only the unions have shown consistent interest in the human problems associated with workplace technological change . . . the main lessons Americans can learn, are related to the *values* underlying the experiments and the many accomplishments of the Swedish approach. Chief among them appears to be a real concern for the welfare of individuals, which naturally extends to the workplace and the quality of work performed there. Jobs not only must provide a decent income, but also should be responsible and intellectually satisfying, to the greatest extent possible; if new technologies bring major changes, then adequate training must be provided; and above all, representatives of affected employees might be actively involved in all stages of the process of change, from initial planning through final implementation and evaluation.[28]

Japan. U.S. industries have surveyed the Japanese system of industrial relations, productivity, and quality control circles. One analyst has concluded that it is a system of ". . . predecision joint consultation to solve the problems of manpower and employment due to drastic technological changes, developed around 1960, and . . . built up to become a basic part of the later Japanese industrial relations. . . . This practice often takes the place of collective bargaining in Japanese industry."[29]

One rare example of a formal technology agreement is that between the Nissan Motor Co. and the Nissan Motor Workers' Union. All 3,000 workers at Nissan's Zama plant participated in quality circles at the time robots were introduced in the 1970's and early 1980's, but the technology agreement only came into being in 1983. However, it does contain a clause which states, "in introducing new technology, the Company shall inform the Union in advance of the introduction of the program, possible effects on union members and proposals of countermeasures against such effects, and hold prior consultations with the Union." Also, "The Company shall neither dismiss nor layoff union members for reasons of the introduction of new technology."[30] Additional provisions address new technology in relation to safety and health, education and training programs, and necessary reassignments and job changes. What is critical is the transition from an earlier joint labor-management consultative agreement (1955) to this new technology agreement which specifically stipulates that the company will provide advance notification, job security, retraining, and the like. Whether this is the beginning of a new pattern in Japanese labor relations remains to be seen.

IN SUMMARY, most other industrial nations have shown greater interest and concern regarding new technology in recent years than has the United States. Unions in those countries have also acquired considerable experience in working out technology agreements and negotiating successfully in various industries.

In countries with a history of cooperation in labor-management relationships, there seems to be a more institutionalized joint approach to dealing with technological change than in those nations, such as the United States, with a tradition of more adversarial labor relations. Technological considerations have been identified in some countries as a critical factor in legislation mandating joint labor-management approaches at the workplace. Whether in the form of work environment legislation or codetermination laws, such regulations nearly always provide for consultation and participation by workers and their representatives in planning and executing technological and organizational design. ☐

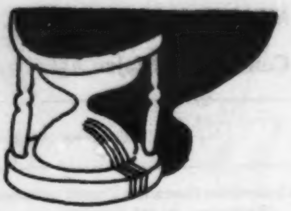
Major Agreements Expiring Next Month



This list of selected collective bargaining agreements expiring in April is based on information from the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more. Private industry is arranged in order of Standard Industrial Classification.

Employer and location	Private industry	Labor organization[1]	Number of workers
Independent Building Contractors (Maine)	Construction	Carpenters	1,300
General Building Contractors and others, Philadelphia area (Pennsylvania)	Construction	Laborers	5,000
Building Contractors Association (New Jersey)	Construction	Carpenters	14,000
General Building Contractors, Philadelphia area (Pennsylvania)	Construction	Carpenters	5,000
Building Trades Employers Association, commercial building agreement (Rochester, NY)	Construction	Carpenters	1,100
Construction Contractors Council–AGC Labor Division, Inc. (Washington, DC and vicinity)	Construction	Carpenters	6,300
Construction Contractors Council–AGC Labor Division, Inc. (Washington, DC and vicinity)	Construction	Operating Engineers	1,100
Associated General Contractors and independent contractors (Lake Charles, LA)	Construction	Laborers	1,000
Associated General Contractors, Central Illinois Builders Chapter (Illinois)	Construction	Carpenters	1,200
Greater Peoria Contractors and Suppliers Association, Inc. (Illinois)	Construction	Laborers	1,500
Associated General Contractors, Builders division (Minneapolis and St. Paul, MN)	Construction	Carpenters	4,000
Associated General Contractors, Builders division (Minnesota)	Construction	Laborers	3,000
Associated General Contractors (St. Louis, MO)	Construction	Laborers	3,000
Construction Employers Association (Cleveland, OH)	Construction	Carpenters	3,500
Building Contractors of Southern New Jersey (New Jersey)	Construction	Carpenters	2,200
Associated General Contractors (Minnesota)	Construction	Iron Workers	1,100
Associated General Contractors, building construction agreement (Ohio)	Construction	Operating Engineers	1,000
Home Builders Association (St. Louis, MO)	Construction	Carpenters	4,500
Associated General Contractors (St. Louis, MO)	Construction	Carpenters	4,500
Associated General Contractors (New Orleans, LA)	Construction	Carpenters	3,000
Associated General Contractors (New Orleans, LA)	Construction	Laborers	1,200
Associated General Contractors, building construction (Minnesota)	Construction	Operating Engineers	1,750
Contractors Association of Eastern Pennsylvania, heavy and highway, Philadelphia area (Pennsylvania)	Construction	Laborers	2,000
Associated General Contractors, heavy and highway (Minnesota)	Construction	Laborers	4,250
Associated General Contractors of Missouri (Western Missouri)	Construction	Laborers	1,000
Ohio Contractors Association and Associated General Contractors (Ohio and West Virginia)	Construction	Teamsters (Ind.)	1,400
Ohio Contractors Association (Ohio)	Construction	Operating Engineers	4,000
Ohio Contractors Association (Ohio and Kentucky)	Construction	Bricklayers; Plasterers and Cement Masons	1,100
Montana Heavy, Highway and Building Contractors (Montana)	Construction	Various unions	5,600
Associated General Contractors (Chicago, IL)	Construction	Teamsters (Ind.)	4,000
Associated General Contractors and independent companies, heavy and highway (Minnesota)	Construction	Carpenters	3,500
Associated General Contractors, Duluth contractors and others (Minnesota)	Construction	Teamsters (Ind.)	1,800
Ohio Contractors Association (Ohio)	Construction	Laborers	10,000
Ohio Contractors Association (Cleveland, OH)	Construction	Teamsters (Ind.)	1,400
Associated General Contractors, heavy and highway (Minnesota)	Construction	Operating Engineers	5,000
Associated General Contractors of St. Louis (St. Louis, MO)	Construction	Operating Engineers	1,200
General Building Contractors Association, building and heavy, Philadelphia area (Pennsylvania)	Construction	Operating Engineers	4,500

See footnotes at end of table.

Continued—Major Agreements Expiring Next Month

Employer and location	Private industry	Labor organization[1]	Number of workers
Construction Contractors Council, commercial construction (Washington, DC and vicinity)	Construction	Laborers	2,500
Contractors Association of Eastern Pennsylvania (Pennsylvania)	Construction	Laborers	1,050
Construction Contractors Council, heavy construction (Washington, DC and vicinity)	Construction	Laborers	1,000
Central New Jersey Painting Contractors Association (New Jersey)	Construction	Painters	1,200
Associated Contractors of Essex County (Network, NJ)	Construction	Carpenters	1,850
National Electrical Contractors Association (Philadelphia, PA)	Construction	Electrical Workers (IBEW)	1,700
Roofing and Sheet Metal Contractors Association (Philadelphia, PA)	Construction	Sheet Metal Workers	1,800
Mechanical Contractors Association of Eastern Pennsylvania, Inc., 2 agreements (Pennsylvania)	Construction	Plumbers	4,200
Painting and Decorating Contractors of America (Minneapolis, MN)	Construction	Painters	1,050
National Electrical Contractors of America (St. Paul, MN)	Construction	Electrical Workers (IBEW)	1,400
Sheet Metal and Air Conditioning Contractors (St. Paul, MN)	Construction	Sheet Metal Workers	1,150
National Electrical Contractors of America (Cleveland, OH)	Construction	Electrical Workers (IBEW)	1,100
Mechanical Contractors Association (New Orleans, LA)	Construction	Plumbers	3,000
Roofing and Sheet Metal Contractors (Philadelphia, PA)	Construction	Roofers	1,700
Associated General Contractors and Minnesota Concrete and Masonry Contractors Association (Minneapolis, MN)	Construction	Bricklayers	1,750
Industrial Contractors (Florida and Georgia)	Construction	Carpenters	1,200
Minnesota Gypsum Drywall Contractors Association (Minneapolis and St. Paul, MN)	Construction	Carpenters	1,000
Chicago Meat Packers (Chicago, IL)	Food products	Teamsters (Ind.)	1,200
J.R. Simplot (Caldwell, ID)	Food products	Teamsters (Ind.)	1,100
Brown and Williamson Tobacco Corp. (Virginia)	Tobacco	Bakery, Confectionery and Tobacco Workers	1,050
James River Corp. (Green Bay, WI)	Paper	Paperworkers	1,000
Proctor and Gamble Paper Products Co. (Green Bay, WI)	Paper	Paperworkers	1,500
Owens–Illinois, Inc. (Interstate)	Rubber	Glass, Pottery, Plastics and Allied Workers	1,300

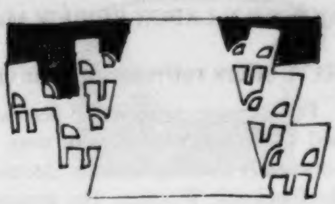
Developments in Industrial Relations



Comparable worth settlements

After suffering some reverses in the last year, backers of the comparable worth concept of pay equity were heartened by a settlement concluding the 5-year controversy between the State of Washington and several unions. Under the out-of-court settlement, nearly 35,000 State workers in predominantly female occupations will receive pay adjustments over a 6-year period to bring them to parity with other State workers in jobs requiring comparable levels of responsibility, skill, and training. In general, backers of the comparable worth concept contend that some workers are underpaid simply because they are in "women's occupations," such as secretaries, librarians, and nurses.

The events leading to the settlement began in 1981 when nine female employees filed suit against the State, contending that a study sponsored by the State showed pay discrimination against women. In 1983, a Federal district judge found the State guilty of pay discrimination under the Federal Civil Rights Act and ordered it to retroactively correct the disparity. In September 1985, the 9th U.S. Circuit Court of Appeals overturned that decision, but the State legislature had already appropriated $41.6 million to finance a settlement to be negotiated with the State, County, and Municipal Employees and other unions representing State employees.

The accord, which will require additional appropriations to cover the $106.5 million total cost, provides for the worth of jobs to be measured in terms of skill, effort, training, education, responsibility, and working conditions. During the first 15 months, $46.5 million will be available for pay adjustments, followed by $10 million allocations on July 1 of 1987 through 1992. The settlement does not provide for retroactivity of the pay adjustments. The 35,000 employees will also receive the same general wage increases the unions negotiate for other employees in their bargaining units during the 6-year period.

Pay equity adjustments also were a feature of an initial contract between the State, County, and Municipal Employees and the city of Chicago for 7,500 white-collar employees. Under the 3-year contract, all employees will receive wage increases totaling about 13 percent. In addition, 3,500 employees in 79 predominantly female job classifications will receive an additional 5 percent, which will be accomplished by raising these workers by one pay grade. According to the parties, 86 percent of the workers scheduled for upgrading are women.

In return for the upgrading, the union agreed to drop sex discrimination charges it had filed with the Equal Employment Opportunity Commission against the city in 1982.

The parties also established a joint job evaluation committee to study the city's pay system and recommend changes, if necessary.

In another area, the parties moved to end political favoritism by adopting criteria to be used in selecting workers for jobs and promotions.

State, County, and Municipal Employees' President Gerald W. McEntee hailed the accord as a "demonstration of the nationwide momentum on pay equity," despite the Appeals Court ruling in the Washington State case. McEntee said that during 1985, the union's "blueprint for equality" program had resulted in pay adjustments of $12 million for 4,000 clericals and librarians in Los Angeles; $20 million for 6,000 workers in the Iowa State government; $40 million for 9,000 employees of the State of Minnesota; $9.1 million for 10,000 employees of the State of Wisconsin; $5.6 million for 9,000 employees of the State of Connecticut; and $36 million to be used for adjusting the pay of thousands of employees of the State of New York.

In another pay equity agreement, the Auto Workers' initial contracts with the State of Michigan included special adjustments (20 cents an hour retroactive to October 1, 1985, and 20 cents effective October 1, 1986) for 70 percent of the 21,000 employees in the two bargaining units. The union said the special pay adjustments were intended to "achieve a greater degree of pay equity between traditionally 'female' State jobs and other jobs."

Terms for all employees included a 5-percent general pay increase effective October 1, 1986; a provision for reopening bargaining on a possible increase in October 1987; reduced employee premium costs for health insurance; and a joint review of workloads and caseloads.

The Auto Workers gained the right to represent the Human Services and Administrative Support units by defeating the incumbent Michigan State Employees Association in 1985 elections.

"Developments in Industrial Relations" is prepared by George Ruben of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

RCA offers retirement inducement

Pay increases totaling 5.5 percent, lump-sum payments, and a retirement inducement were featured in settlements between RCA Corp. and the Electrical Workers (IBEW) and the Electronic Workers. The separate but coordinated bargaining by the two unions covered 14,500 workers at 12 electrical products plants.

The first cash payment, payable immediately, was equal to 3 percent of employee earnings from November 1, 1984, through October 31, 1985. Instead of continuing the provision for automatic annual cost-of-living adjustments in hourly pay based on the movement of the Consumer Price Index, employees will receive lump-sum payments of $225 on June 2, 1986, $500 on June 1, 1987, and $525 on June 6, 1988.

Hourly pay rates will increase by 3 percent on December 1, 1986, and 2.5 percent on December 7, 1987. Workers in the upper pay grades will also receive an additional 5 to 20 cents and 5 to 15 cents an hour on the respective dates.

Pay progression was extended, with new employees starting at 80 percent of the standard rate for their job and receiving 5 percentage point increases every 6 months until they attain the standard rate.

The retirement inducement, limited to workers leaving the company between January 1 and July 1 of 1986, is $5,000. It is available to employees with 30 years of service or whose age plus years of service total 85.

Other terms include a two-step increase in the pension rate to $16 a month (from $14) for each year of credited service; three $100 credits to employees under a stock purchase plan; and some changes to help restrain the rise in health insurance costs.

Grocery workers accept concessions

Following the lead of a June 1985 settlement with major St. Louis grocery store chains, United Food and Commercial Workers locals 219 and 35 and three chains in nearby Illinois agreed on cuts in pay and benefits to aid the companies in competing with nonunion stores.

The Illinois agreement cut the top rate for clerks to $10.80 an hour, from $11.15, effective immediately, and to $10.50 in November 1986. Workers below the top rate will have their rates frozen for the term of the contract, which expires on November 26, 1988. To some extent, the pay cut and freeze will be offset by bonuses totaling $1,000 to $1,200, depending on the number of hours an employee works. Half of the bonus will be distributed in 1986 and the balance in 1987 and 1988.

The contract also provided for:

- A top rate of $6.50 an hour for employees who work less than 30 hours a week. Previously there was no pay cap for these employees.
- For workers hired after the effective date of the contract, Sunday work premium pay of $1 an hour during their first year and $2 an hour thereafter. Current employees will continue to receive time and one-half pay for work on Sunday.
- A 9-cent reduction, to 76 cents an hour, in the employers' payment to the health and welfare trust fund. Benefits financed by the fund were not reduced.
- Elimination of a sixth week of paid vacation after 25 years of service. Currently eligible workers will continue to receive 6 weeks.
- Elimination of one personal paid holiday and four paid sick leave days beginning January 1, 1986.
- Reduced employer financing of health and welfare and pension benefits for new employees.
- A guarantee that 50 percent of scheduled work hours will be given to employees who normally work 40 hours a week and 10 percent to those who normally work at least 30 hours a week. The union said these requirements will help counter a trend toward increasing use of part-time workers, to the detriment of full-time workers.

The three chains covered by the settlement are the Kroger Co., National Supermarkets, and Schnuck Markets.

Alaska construction workers agree to a pay cut

Concern about the possibility of losing work to nonunion construction firms impelled unions in Alaska's petroleum producing area to agree to a 20-percent pay cut during the first year of their new 2-year agreement with the North Slope Contractors Association. Pay rates for the second year will be negotiated under a mid-term contract reopening provision.

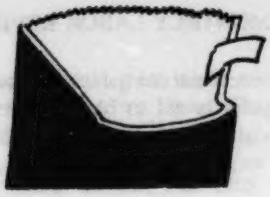
The deciding factor in the unions' decision apparently was the oil companies 1985 announcement that bidding for projects would be opened to both union and nonunion contractors. Traditionally, most of the construction on the North Slope has been performed by unionized firms.

A union official said that the pay cut was not popular with union members, but it must be viewed in relation to the still-substantial earnings opportunity resulting from company-financed rooms, meals, and transportation, and a usual 70-hour work week.

Among the affected crafts, pay rates for plumbers and welders dropped to $20.94 an hour, from $26.17, and laborers dropped to $16.27, from $20.34. Employer payments for benefits remained at $6.10 an hour for the plumbers and welders and $6.45 for the laborers.

Other terms include a 40-hour work week guarantee; a limit of time and one-half pay for all work in excess of 8 hours per day; regular pay rates for work on second or third shifts, if such shifts are established; and a cut in the number of paid travel hours from the Fairbanks dispatch point. □

Book Reviews



New technology requires new management

Beyond Mechanization. By Larry Hirschhorn. Cambridge, MA, The MIT Press, 1984. 187 pp., bibliography. $17.50.

Larry Hirschhorn's thesis is compelling. The production technology of the processing plant and computerized flexible manufacturing systems require a new approach to organizational design and management. In the older electromechanical factories, work could be broken down into measurable motions, and the worker trained to perform repetitive tasks, coordinated and controlled at higher levels. The new technology makes this approach unsafe and unproductive, since complex technological systems are vulnerable to costly breakdowns. The alternative is a different vision of organization and work roles in which operators develop diagnostic and maintenance skills, and are prepared to deal with the unexpected. Working together in self-regulating teams, they share information and rotate jobs to expand their knowledge of what can go wrong, and why. In this system, supervisors become teachers and coordinators, not policemen. If this approach had been employed at the Three Mile Island nuclear reactor, Hirschhorn believes operators would have been better prepared to have closed a valve quickly and avoided the danger of meltdown.

This concept is fully consistent with Joan Woodward's research in the 1960's showing that continuous processing plants (for example paper and pulp, chemicals, and oil refineries) were best run when operators had the training and authority to make decisions. It is supported by the sociotechnical theories of Eric Trist, Louis Davis, and Richard Walton, who was a consultant to the General Foods plant in Topeka, KS, which was designed according to the team concept in 1970. Hirschhorn points out that during the past decade, more than 500 American plants have been designed according to the team principle, generally with job rotation and salary, not wages, based on tasks mastered. "A worker may be a materials scheduler, a work assigner, a trainer, a financial coordinator managing the team's budget, a health and safety coordinator, a recorder, or the team's representative on a committee studying social-system issues throughout the plant" (p. 117).

Beyond improved safety and less likelihood of errors, what are the costs and benefits of the new plants? Writes Hirschhorn, "I know of no systematic study comparing the long-term performance of these plants with that over conventional ones. Cases studies and my own interviews with managerial and supervisory staff suggest that these plants produce a higher quality product than do conventional factories, while remaining profitable" (p. 120).

Yet, there are serious problems with many of these innovative work systems, and they are social rather than technical. Hirschhorn interviewed 22 managers and consultants, and two workers at 13 new plants. (The companies would not let him interview more workers.) He found one source of ineffectiveness when idealistic plant managers expected teams to govern themselves without skilled leadership and sufficient training in a group process. Disputes undermined effectiveness. Workers refused to discipline colleagues who abused trust. When teamwork broke down, disillusioned managers imposed traditional control. Most of these plants are nonunion, and it is notable that in one unionized factory, Hirschhorn finds better discipline, more effectiveness at resolving disputes. When there is experienced union leadership, utopian ideas are less likely to cloud the vision.

Hirschhorn touches on many factors that he believes impede the development of better sociotechnical solutions, including the problem of fitting the innovative factories into industrial bureaucracies. The new pay systems and job classifications clash with corporate policy. Here again, a strong union could help institutionalize a new approach.

Finally, Hirschhorn directs criticism at engineers for ignoring the human element in designing production systems. Like many who write today from a humanistic viewpoint, he blasts the founder of scientific management, Frederick Windslow Taylor, for having "introduced the study of human motion within a perspective emptied of psychological and physiological content" (p. 13). In his time, Taylor was concerned with the health and development of the worker. Like Hirschhorn, he complained of over-controlling managers. The difference is that Taylor's theory fit the simpler technology of his day and the poorly educated immigrant workers he first studied. Today's technology and work force require different organization, but as Hirschhorn points out, our social R&D lags behind technical development. The point is not to blame the engineers but to show them a viable, more productive alternative.

NOTES ON CURRENT LABOR STATISTICS

This section of the Review presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force, employment, unemployment, collective bargaining settlements, consumer, producer, and international prices, productivity, international comparisons, and injury and illness statistics. In the notes that follow, the data in each group of tables is briefly described, key definitions are given, notes on the data are set forth, and sources of additional information are cited.

General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as "seasonally adjusted." (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. (Seasonally adjusted data appear in tables 1–3, 4–10, 13, 14, and 18.) Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X–11 ARIMA, which was developed at Statistics Canada as an extension of the standard X–11 method previously used by BLS. A detailed description of the procedure appears in *The X–11 ARIMA Seasonal Adjustment Method* by Estla Bee Dagum (Statistics Canada, Catalogue No. 12–564E, January 1983). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. However, revisions of historical data continue to be made only at the end of each calendar year.

Seasonally adjusted labor force data in tables 1 and 4–10 were revised in the February 1986 issue of the *Review* to reflect experience through 1985.

Annual revisions of the seasonally adjusted payroll data shown in tables 13, 14, and 18 were made in July 1985 using the X–11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in table 42 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data—such as the Hourly Earnings Index in table 17—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The $2 (or any other resulting values) are described as "real," "constant," or "1967" dollars.

Additional information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule preceding these general notes. More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in *Employment and Earnings*, a monthly publication of the Bureau. More data from the household survey is published in the two-volume data book—*Labor Force Statistics Derived From the Current Population Survey*, Bulletin 2096. More data from the establishment survey appear in two data books—*Employment, Hours, and Earnings, United States*, and *Employment, Hours, and Earnings, States and Areas*, and the annual supplements to these data books. More detailed information on employee compensation and collective bargaining settlements is published in the monthly periodical, *Current Wage Developments*. More detailed data on consumer and producer prices are published in the monthly periodicals, *The CPI Detailed Report*, and *Producer Prices and Price Indexes*. Detailed data on all of the series in this section are provided in the *Handbook of Labor Statistics*, which is published biennally by the Bureau. BLS bulletins are issued covering productivity, injury and illness, and other data in this section. Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

Symbols

p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally, this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.
n.e.s. = not elsewhere specified.

COMPARATIVE INDICATORS
(Tables 1–3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-to-population ratio, and unemployment rates for major demographic groups based on the Current Population ("household ") Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonagricultural payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on **changes in compensation, prices, and productivity** are presented in table 2. Measures of rates of change of compensation and wages

from the Employment Cost Index program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; and the overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data. For detailed descriptions of each data series, see *BLS Handbook of Methods*, Volumes I and II, Bulletins 2134-1 and 2134-2 (Bureau of Labor Statistics, 1982 and 1984, respectively), as well as the additional bulletins, articles, and other publications noted in the separate sections of the *Review*'s "Current Labor Statistics Notes." Historical data for many series are provided in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). Users may also wish to consult *Major Programs, Bureau of Labor Statistics*, Report 718 (Bureau of Labor Statistics, 1985).

EMPLOYMENT DATA

(Tables 1; 4–21)

Household Survey Data

Description of the series

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 59,500 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons include (1) all civilians who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. Members of the Armed Forces stationed in the United States are also included in the employed total. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **overall unemployment rate** represents the number unemployed as a percent of the labor force, including the resident Armed Forces. The **civilian unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **labor force** consists of all employed or unemployed civilians plus members of the Armed Forces stationed in the United States. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons who are retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy, and members of the Armed Forces stationed in the United States. The **labor force participation rate** is the proportion of the noninstitutional populaton that is in the labor force. The **employment-population ratio** is total employment (including the resident Armed Forces) as a percent of the noninstitutional population.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 4–10 are seasonally adjusted, based on the seasonal experience through December 1985.

Additional sources of information

For detailed explanations of the data, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982) and for additional data, *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). A detailed description of the Current Population Survey as well as additional data are available in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*. Historical data from 1948 to 1982 are available in *Labor Force Statistics Derived from the Current Population Survey: A Databook*, Vols. I and II, Bulletin 2096 (Bureau of Labor Statistics, 1982).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Establishment Survey Data

Description of the series

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by more than 200,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday

and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 12-16 include production workers in manufacturing and mining; construction workers in construction; and for nonsupervisory workers in the following industries: transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for about four-fifths of the total employment on private nonagricutural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earner and Clerical Workers (CPI-W). The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index, introduced in table 17 of the May 1983 issue, represents the percent of 185 nonagricultural industries in which employment was rising over the indicated period. One-half of the industries with unchanged employment are counted as rising. In line with Bureau practice, data for the 1-, 3-, and 6-month spans are seasonally adjusted, while those for the 12-month span are unadjusted. The diffusion index is useful for measuring the dispersion of economic gains or losses and is also an economic indicator.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of May 1985 data, published in the July 1985 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Unadjusted data have been revised back to April 1983; seasonally adjusted data have been revised back to January 1980. These revisions were published in the *Supplement to Employment and Earnings* (Bureau of Labor Statistics, 1985). Unadjusted data from April 1984 forward, and seasonally adjusted data from January 1981 forward are subject to revision in future benchmarks.

Additional sources of information

Detailed data from the establishment survey are published monthly in the BLS periodical, *Employment and Earnings*. Earlier comparable unadjusted and seasonally adjusted data are published in *Employment, Hours, and Earnings, United States, 1909–84*, Bulletin 1312–12 and its annual supplement (Bureau of Labor Statistics, 1985). For a detailed discussion of the methodology of the survey, see *BLS Handbook of Methods*, Bulletin 2143–1 (Bureau of Labor Statistics, 1982). For additional data, see *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Unemployment Data By State

Description of the series

Data presented in this section are obtained from two major sources—the Current Population Survey (CPS) and the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act and the Public Works and Economic Development Act. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

Notes on the data

Data refer to State of residence. Monthly data for 11 States—California, Florida, Illinois, Massachusetts, Michigan, New York, New Jersey, North Carolina, Ohio, Pennsylvania, and Texas—are obtained directly from the CPS because the size of the sample is large enough to meet BLS standards of reliability. Data for the remaining 39 States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates for the 11 States are revised to new population controls. For the remaining States and the District of Columbia, data are benchmarked to annual average CPS levels.

Additional sources of information

Information on the concepts, definitions, and technical procedures used to develop labor force data for States and sub-State areas as well as additional data on sub-States are provided in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*, and the annual report, *Geographic Profile of Employment and Unemployment* (Bureau of Labor Statistics). See also *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982).

COMPENSATION AND WAGE DATA

(Tables 22–29)

COMPENSATION AND WAGE DATA are gathered by the Bureau from business establishments, State and local governments, labor unions, collective bargaining agreements on file with the Bureau, and secondary sources.

Employment Cost Index

Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It uses a fixed market basket of labor—similar in concept to the Consumer Price Index's fixed market basket of goods and services—to measure change over time in employer costs of employing labor. The index is not seasonally adjusted.

Statistical series on total compensation costs and on wages and salaries are available for private nonfarm workers excluding proprietors, the self-employed, and household workers. Both series are also available for State and local government workers and for the civilian nonfarm economy, which consists of private industry and State and local government workers combined. Federal workers are excluded.

The Employment Cost Index probability sample consists of about 2,200 private nonfarm establishments providing about 12,000 occupational observations and 700 State and local government establishments providing

3,500 occupational observations selected to represent total employment in each sector. On average, each reporting unit provides wage and compensation information on five well-specified occupations. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Fixed employment weights from the 1970 Census of Population are used each quarter to calculate the indexes for civilian, private, and State and local governments. These fixed weights, also used to derive all of the industry and occupation series indexes, ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the bargaining status, region, and metropolitan/nonmetropolitan area series, however, employment data by industry and occupation are not available from the census. Instead, the 1970 employment weights are reallocated within these series each quarter based on the current sample. Therefore, these indexes are not strictly comparable to those for the aggregate, industry, and occupation series.

Definitions

Total compensation costs include wages, salaries, and the employer costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as social security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

Notes on the data

The Employment Cost Index data series began in the fourth quarter of 1975, with the quarterly percent change in wages and salaries in the private nonfarm sector. Data on employer costs for employee benefits were included in 1980 to produce, when combined with the wages and salaries series, a measure of the percent change in employer costs for employee total compensation. State and local government units were added to the ECI coverage in 1981, providing a measure of total compensation change in the *civilian* nonfarm economy (excluding Federal employees). Historical indexes (June 1981 = 100) of the quarterly rates of change are presented in the May issue of the BLS monthly periodical, *Current Wage Developments*.

Additional sources of information

For a more detailed discussion of the Employment Cost Index, see Chapter 11, "The Employment Cost Index," in the *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), and the following *Monthly Labor Review* articles: "Employment Cost Index: a measure of change in the 'price of labor'," July 1975; "How benefits will be incorporated into the Employment Cost Index," January 1978; "Estimation procedures for the Employment Cost Index," May 1982; and "Introducing new weights for the Employment Cost Index," June 1985.

Data on the ECI are also available in BLS quarterly press releases issued in the month following the reference months of March, June, September, and December; and from the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

Collective bargaining settlements

Description of the series

Collective bargaining settlements data provide statistical measures of negotiated adjustments (increases, decreases, and freezes) in compensation (wages and benefits costs) and wages alone, quarterly for private industry and semiannually for State and local government. Compensation measures cover all collective bargaining situations involving 5,000 workers or more and wage measures cover all situations involving 1,000 workers or more. These data, covering private nonagricultural industries and State and local governments, are calculated using information obtained from bargaining agreements on file with the Bureau, parties to the agreements, and secondary sources, such as newspaper accounts. The data are not seasonally adjusted.

Settlement data are measured in terms of future specified adjustments: those that will occur within 12 months after contract ratification—first year—and all adjustments that will occur over the life of the contract expressed as an average annual rate. Adjustments are worker weighted. Both first-year and over-the-life measures exclude wage changes that may occur under cost-of-living clauses that are triggered by future movements in the Consumer Price Index.

Effective wage adjustments measure all adjustments occurring in the reference period, regardless of the settlement date. Included are changes from settlements reached during the period, changes deferred from contracts negotiated in earlier periods, and changes under cost-of-living adjustment clauses. Each wage change is worker weighted. The changes are prorated over all workers under agreements during the reference period yielding the average adjustment.

Definitions

Wage rate changes are calculated by dividing newly negotiated wages by the average hourly earnings, excluding overtime, at the time the agreement is reached. Compensation changes are calculated by dividing the change in the value of the newly negotiated wage and benefit package by existing average hourly compensation, which includes the cost of previously negotiated benefits, legally required social insurance programs, and average hourly earnings.

Compensation changes are calculated by placing a value on the benefit portion of the settlements at the time they are reached. The cost estimates are based on the assumption that conditions existing at the time of settlement (for example, methods of financing pensions or composition of labor force) will remain constant. The data, therefore, are measures of negotiated changes and not of total changes in employer cost.

Contract duration runs from the effective date of the agreement to the expiration date or first wage reopening date, if applicable. Average annual percent changes over the contract term take account of the compounding of successive changes.

Notes on the data

Care should be exercised in comparing the size and nature of the settlements in State and local government with those in the private sector because of differences in bargaining practices and settlement characteristics. A principal difference is the incidence of cost-of-living adjustment (COLA) clauses which cover only about 2 percent of workers under a few local government settlements but cover 50 percent of workers under private sector settlements. Agreements without COLA's tend to provide larger specified wage increases than those with COLA's. Another difference is that State and local government bargaining frequently excludes pension benefits which are often prescribed by law. In the private sector, in contrast, pensions are typically a bargaining issue.

Additional sources of information

For a more detailed discussion on the series, see chapter 10, "Negotiated Wage and Benefit Changes," of the *BLS Handbook of Methods*, Bulletin 2134–1. Comprehensive data are published in press releases issued quarterly (in January, April, July, and October) for private industry, and semi-

annually (in February and August) for State and local government. Historical data and additional detailed tabulations for the prior calendar year appear in the April issue of the BLS monthly periodical, *Current Wage Developments*.

Work stoppages

Description of the series

Data on **work stoppages** measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of time lost because of stoppage.

Data are largely from newspaper accounts and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate number of work days lost by workers involved in the stoppages.

Days of idleness as a percent of estimated working time: Aggregate work days lost as a percent of the aggregate number of standard work days in the period multiplied by total employment in the period.

Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

Additional sources of information

Data for each calendar year are reported in a BLS press release issued in the first quarter of the following year. Monthly data appear in the BLS monthly periodical, *Current Wage Developments*. Historical data appear in the BLS *Handbook of Labor Statistics*.

Other compensation data

Other BLS data on pay and benefits, not included in the Current Labor Statistics section of the *Monthly Labor Review*, appear in and consist of the following:

Industry Wage Surveys provide data for specific occupations selected to represent an industry's wage structure and the types of activities performed by its workers. The Bureau collects information on weekly work schedules, shift operations and pay differentials, paid holiday and vacation practices, and information on incidence of health, insurance, and retirement plans. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Monthly Labor Review*.

Area Wage Surveys annually provide data for selected office, clerical, professional, technical, maintenance, toolroom, powerplant, material movement, and custodial occupations common to a wide variety of industries in the areas (labor markets) surveyed. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Review*.

The National Survey of Professional, Administrative, Technical, and Clerical Pay provides detailed information annually on salary levels and distributions for the types of jobs mentioned in the survey's title in private employment. Although the definitions of the jobs surveyed reflect the duties and responsibilities in private industry, they are designed to match specific pay grades of Federal white-collar employees under the General Schedule pay system. Accordingly, this survey provides the legally required information for comparing the pay of salaried employees in the Federal civil service with pay in private industry. (See Federal Pay Comparability Act of 1970, 5 U.S.C. 5305.) Data are published in a BLS news release issued in the summer and in a bulletin each fall; summaries and analytical articles also appear in the *Review*.

Employee Benefits Survey provides nationwide information on the incidence and characteristics of employee benefit plans in medium and large establishments in the United States, excluding Alaska and Hawaii. Data are published in an annual BLS news release and bulletin, as well as in special articles appearing in the *Review*.

PRICE DATA
(Tables 30–41)

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Consumer Price Indexes

Description of the series

The **Consumer Price Index** (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all urban consumer index (CPI-U) introduced in 1978 is representative of the 1972–73 buying habits of about 80 percent of the noninstitutional population of the United States at that time, compared with 40 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 24,000 retail establishments and 24,000 tenants in 85 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 28 major urban centers are presented in table 31. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are measured for the CPI-U. A rental-equivalence method replaced the

asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes.

Additional sources of information

For a discussion of the general method for computing the CPI, see *BLS Handbook of Methods, Volume II, The Consumer Price Index*, Bulletin 2134–2 (Bureau of Labor Statistics, April 1984). The recent change in the measurement of homeownership costs is discussed in Robert Gillingham and Walter Lane, "Changing the treatment of shelter costs for homeowners in the CPI," *Monthly Labor Review*, June 1982, pp. 9–14.

Additional detailed CPI data and regular analyses of consumer price changes are provided in the *CPI Detailed Report*, a monthly publication of the Bureau. Historical data for the overall CPI and for selected groupings may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

Producer Price Indexes

Description of the series

Producer Price Indexes (PPI) measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 60,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The stage of processing structure of Producer Price Indexes organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1976, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

Notes on the data

Beginning with the January 1986 issue, the *Review* is no longer presenting tables of Producer Price Indexes for commodity groupings, special composite groups, or SIC industries. However, these data will continue to be presented in the Bureau's monthly publication *Producer Price Indexes*. Series on the net output of major mining and manufacturing industry groups will appear in the *Review* starting with data for July 1986.

The Bureau has completed the first major stage of its comprehensive overhaul of the theory, methods, and procedures used to construct the Producer Price Indexes. Changes include the replacement of judgment sampling with probability sampling techniques; expansion to systematic coverage of the net output of virtually all industries in the mining and manufacturing sectors; a shift from a commodity to an industry orientation; the exclusion of imports from, and the inclusion of exports in, the survey universe; and the respecification of commodities priced to conform to Bureau of the Census definitions. These and other changes have been phased in gradually since 1978. The result is a system of indexes that is easier to use in conjunction with data on wages, productivity, and employment and other series that are organized in terms of the Standard Industrial Classification and the Census product class designations.

Additional sources of information

For a discussion of the methodology for computing Producer Price Indexes, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 7.

Additional detailed data and analyses of price changes are provided monthly in *Producer Price Indexes*. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

International Price Indexes

Description of the series

The BLS **International Price Program** produces quarterly export and import price indexes for nonmilitary goods traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts: it includes corporations, businesses, and individuals but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents. With publication of an all-import index in February 1983 and an all-export index in February 1984, all U.S. merchandise imports and exports now are represented in these indexes. The reference period for the indexes is 1977 = 100, unless otherwise indicated.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected quarterly by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S. border for imports. For nearly all products, the prices refer to transactions completed during the first 2 weeks of the third month of each calendar quarter—March, June, September, and December. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined by the 4- and 5-digit level of detail of the Standard Industrial Trade Classification System (SITC). The calculation of indexes by SITC category facilitates the comparison of U.S. price trends and sector production with similar data for other countries. Detailed indexes are also computed and published on a Standard Industrial Classification (SIC-based) basis, as well as by end-use class.

Notes on the data

The export and import price indexes are weighted indexes of the Laspeyeres type. Price relatives are assigned equal importance within each weight category and are then aggregated to the SITC level. The values assigned to each weight category are based on trade value figures compiled

by the Bureau of the Census. The trade weights currently used to compute both indexes relate to 1980.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's quarterly questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

For the export price indexes, the preferred pricing basis is f.a.s. (free alongside ship) U.S. port of exportation. When firms report export prices f.o.b. (free on board), production point information is collected which enables the Bureau to calculate a shipment cost to the port of exportation. An attempt is made to collect two prices for imports. The first is the import price f.o.b. at the foreign port of exportation, which is consistent with the basis for valuation of imports in the national accounts. The second is the import price c.i.f. (cost, insurance, and freight) at the U.S. port of importation, which also includes the other costs associated with bringing the product to the U.S. border. It does not, however, include duty charges.

Additional sources of information

For a discussion of the general method of computing International Price Indexes, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 8.

Additional detailed data and analyses of international price developments are presented in the Bureau's quarterly publication *U.S. Import and Export Price Indexes* and in occasional *Monthly Labor Review* articles prepared by BLS analysts. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, June 1985).

PRODUCTIVITY DATA
(Tables 42–47)

U. S. productivity and related data

Description of the series

The productivity measures relate real physical output to real input. As such they encompass a family of measures which include single factor input measures, such as output per unit of labor input (output per hour) or output per unit of capital input, as well as measures of multifactor productivity (output per unit of labor and capital inputs combined). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

Definitions

Output per hour of all persons (labor productivity) is the value of goods and services in constant prices produced per hour of labor input. **Output per unit of capital services** (capital productivity) is the value of goods and services in constant dollars produced per unit of capital services input.

Multifactor productivity is the ratio output per unit of labor and capital inputs combined. Changes in this measure reflect changes in a number of factors which affect the production process such as changes in technology, shifts in the composition of the labor force, changes in capacity utilization, research and development, skill and efforts of the work force, management, and so forth. Changes in the output per hour measures reflect the impact of these factors as well as the substitution of capital for labor.

Compensation per hour is the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, and the wages, salaries, and supplementary payments for the self-employed (except for nonfinancial corporations in which there are no self-employed)—the sum divided by hours paid for. **Real compensation per hour** is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs is the labor compensation costs expended in the production of a unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current dollar value of output and dividing by output. **Unit nonlabor costs** contain all the components of unit nonlabor payments *except* unit profits.

Unit profits include corporate profits and the value of inventory adjustments per unit of output.

Hours of all persons are the total hours paid of payroll workers, self-employed persons, and unpaid family workers.

Capital services is the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories—weighted by rental prices for each type of asset.

Labor and capital inputs combined are derived by combining changes in labor and capital inputs with weights which represent each component's share of total output. The indexes for capital services and combined units of labor and capital are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

Notes on the data

Output measures for the business sector and the nonfarm businesss sector exclude the constant dollar value of owner-occupied housing, rest of world, households and institutions, and general government output from the constant dollar value of gross national product. The measures are derived from data supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are developed from data of the Bureau of Labor Statistics and the Bureau of Economic Analysis.

The productivity and associated cost measures in tables 42–44 describe the relationship between output in real terms and the labor time and capital services involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input. Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and efforts of the work force.

Additional sources of information

Descriptions of methodology underlying the measurement of output per hour and multifactor productivity are found in the *BLS Handbook of Methods*, Bulletin 2134, Vol. 1, Chapter 13 (Bureau of Labor Statistics, 1982). Historical data for selected industries are provided in the Bureau's *Handbook of Labor Statistics*, Bulletin 2217, 1985.

International comparisons

Description of the series

Comparative measures of labor force, employment, and unemployment (tables 45 and 46) are prepared regularly for the United States, Canada, Australia, Japan, France, Germany, Great Britain, Italy, the Netherlands, and Sweden. Unemployment rates, approximating U.S. concepts, are prepared monthly for most of the countries; the other measures, annually.

The Bureau of Labor Statistics also prepares international comparisons of manufacturing labor productivity and labor costs (table 47) that cover the United States and 11 foreign countries—those listed above plus Belgium and Norway. These measures are limited to trend comparisons; that is, intercountry series of changes over time, rather than level comparisons because reliable international comparisons of the levels of manufacturing are unavailable. The U.S. measures are described in the notes on U.S. productivity measurement; the measures for foreign countries are compiled from various national and international data sources.

Definitions

Output measures are constant value output (value added) from the national accounts of each country, except for those for Japan prior to 1970 and for the Netherlands for 1969 forward, which are indexes of industrial production. The national accounting methods for measuring real output differ considerably among the 12 countries, but the use of different procedures does not, in itself, connote lack of comparability—rather, it reflects differences among countries in the availability and reliability of underlying data series.

Hours and compensation measures refer to all employed persons including the self-employed in the United States and Canada, and to all wage and salary employees in the other countries. *Hours* refer to hours *paid* in the United States, hours *worked* in the other countries. *Compensation (labor costs)* includes not only all payments made directly to employees and employer expenditures for social insurance and private benefit plans, but changes in significant employment or payroll taxes that are not compensation to employees but are labor costs to employers (France, Sweden, and the United Kingdom). Self-employed workers are included in the U.S. and Canadian figures by assuming that their hourly compensation is equal to the average for wage and salary employees.

Notes on the data

The data for the foreign countries in tables 45 and 46 have been adjusted, where necessary, for greater comparability with U.S. definitions of employment and unemployment. The adjusted statistics have been adapted to the age at which compulsory schooling ends in each country. Therefore, the adjusted statistics relate to the civilian population age 16 and over in the United States, France, and Sweden, and from 1973 onward, Great Britain; 15 and over in Canada, Australia, Japan, Germany, and the Netherlands; and 14 and over in Italy. Prior to 1973, the data for Great Britain related to persons age 15 and over. The institutional population is included in the denominator of the labor force participation rates and employment-population rates for Japan and Germany.

For most of the countries in table 47, the measures refer to total manufacturing as defined by the International Standard Industrial Classification. However, the measures for France (beginning 1959), Italy (beginning 1970), and the United Kingdom (beginning 1976) refer to manufacturing and mining less energy-related products. For all countries, manufacturing includes the activities of government enterprises.

In addition, for all countries, preliminary estimates for recent years are generally based on current indicators of manufacturing output, employment and hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

Additional sources of information

For further information, see *International Comparisons of Unemployment*, Bulletin 1979 (Bureau of Labor Statistics, 1978), Appendix B and Supplements to Appendix B. Additional detail is also found in the *BLS Handbook of Methods*, Bulletin 2134, Vol. 1, Chapter 16. Additional international comparison statistics are available in the *Handbook of Labor Statistics* (BLS Bulletin 2217, 1985). The most recent statistics are presented and analyzed annually in the *Monthly Labor Review*, typically in the December issue (for the previous year) and in February.

OCCUPATIONAL INJURY AND ILLNESS DATA

(Table 48)

Description of the series

The Annual Survey of Occupational Injuries and Illnesses is designed to collect data on injuries and illnesses based on records which employers in the following industries maintain under the Occupational Safety and Health Act of 1970: agriculture, forestry, and fishing; oil and gas extraction; construction; manufacturing; transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. Excluded from the survey are self-employed individuals, farmers with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies.

Because the survey is a Federal–State cooperative program and the data must meet the needs of participating State agencies, an independent sample is selected for each State. The sample is selected to represent all private industries in the States and territories. The sample size for the survey is dependent upon (1) the characteristics for which estimates are needed; (2) the industries for which estimates are desired; (3) the characteristics of the population being sampled; (4) the target reliability of the estimates; and (5) the survey design employed.

While there are many characteristics upon which the sample design could be based, the total recorded case incidence rate is used because it is one of the most important characteristics and the least variable; therefore, it requires the smallest sample size.

The survey is based on stratified random sampling with a Neyman allocation and a ratio estimator. The characteristics used to stratify the establishments are the Standard Industrial Classification (SIC) code and size of employment.

Definitions

Recordable occupational injuries and illnesses are: (1) occupational deaths, regardless of the time between injury and death, or the length of the illness; or (2) nonfatal occupational illnesses; or (3) nonfatal occupational injuries which involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment (other than first aid).

Occupational injury is any injury such as a cut, fracture, sprain, amputation, etc., which results from a work accident or from exposure involving a single incident in the work environment.

Occupational illness is an abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday cases are cases which involve days away from work, or days of restricted work activity, or both.

Lost workday cases involving restricted work activity are those cases which result in restricted work activity only.

Lost workdays away from work are the number of workdays (consecutive or not) on which the employee would have worked but could not

because of occupational injury or illness.

Lost workdays—restricted work activity are the number of workdays (consecutive or not) on which, because of injury or illness: (1) the employee was assigned to another job on a temporary basis; or (2) the employee worked at a permanent job less than full time; or (3) the employee worked at a permanently assigned job but could not perform all duties normally connected with it.

The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked even though able to work.

Incidence rates represent the number of injuries and/or illnesses or lost workdays per 100 full-time workers.

Notes on the data

Estimates are made for industries and employment-size classes and for severity classification: fatalities, lost workday cases, and nonfatal cases without lost workdays. Lost workday cases are separated into those where the employee would have worked but could not and those in which work activity was restricted. Estimates of the number of cases and the number of days lost are made for both categories.

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses, or lost workdays, per 100 full-time employees. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Only a few of the available measures are included in the *Handbook of Labor Statistics*. Full detail is presented in the annual bulletin, *Occupational Injuries and Illnesses in the United States, by Industry*.

Comparable data for individual States are available from the BLS Office of Occupational Safety and Health Statistics.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration, respectively. Data from these organizations are included in BLS and State publications. Federal employee experience is compiled and published by the Occupational Safety and Health Administration. Data on State and local government employees are collected by about half of the States and territories; these data are not compiled nationally.

Additional sources of information

The Supplementary Data System provides detailed information describing various factors associated with work-related injuries and illnesses. These data are obtained from information reported by *employers* to State workers' compensation agencies. The Work Injury Report program examines selected types of accidents through an employee survey which focuses on the circumstances surrounding the injury. These data are not included in the *Handbook of Labor Statistics* but are available from the BLS Office of Occupational Safety and Health Statistics.

The definitions of occupational injuries and illnesses and lost workdays are from *Recordkeeping Requirements under the Occupational Safety and Health Act of 1970*. For additional data, see *Occupational Injuries and Illnesses in the United States, by Industry*, annual Bureau of Labor Statistics bulletin; BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), ch. 17; *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985), pp. 411–14; annual reports in the *Monthly Labor Review*; and annual U.S. Department of Labor press releases.

---

[1] The population figures are not seasonally adjusted.

[2] Civilian employment as a percent of the civilian noninstitutional population.

[3] Data for 1980–85 have been revised to reflect new population estimates.

NOTE: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" groups are not presented and Hispanics are included in both the white and black population groups.

6. Selected employment indicators, monthly data seasonally adjusted

---

[1] Cost (cents-per-hour worked) measured in the Employment Cost Index consists of wages, salaries and employer cost of employee benefits.

[2] Consist of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.

[3] Consists of legislative, judicial, administrative, and regulatory activities.

[4] Includes, for example, library, social, and health services.

23. Employment Cost Index, wages and salaries only, by occupation and industry group

[1] The indexes are calculated differently from those for the occupation and industry groups. For a detailed description of the index calculation, see the *Monthly Labor Review* Technical Note, "Estimation procedures for the Employment Cost Index," May 1982.

25. Specified compensation and wage adjustments from contract settlements, and effective wage adjustments, private industry collective bargaining situations covering 1,000 workers or more (in percent)

Measure	Annual average		Quarterly average							
			1984				1985			
	1984	1985	I	II	III	IV	I	II^p	III^p	IV^p
Specified adjustments:										
Total compensation [1] adjustments, [2] settlements covering 5,000 workers or more:										
First year of contract	3.6	2.6	5.1	3.5	2.7	3.7	3.6	3.5	2.0	2.0
Annual rate over life of contract	2.8	2.7	4.7	3.2	3.1	2.0	2.7	3.4	3.0	1.4
Wage adjustments, settlements covering 1,000 workers or more:										
First year of contract	2.4	2.3	2.8	2.6	2.1	2.3	3.3	2.5	2.0	2.1
Annual rate over life of contract	2.4	2.7	3.3	2.7	2.6	1.5	3.2	2.8	3.1	1.9
Effective adjustments:										
Total effective wage adjustment [3]	3.7	3.3	.9	.9	1.2	.7	.8	.8	1.2	.5
From settlements reached in period	.8	.7	.1	.1	.2	.3	.1	.2	.2	.2
Deferred from settlements reached in earlier periods	2.0	1.8	.4	.7	.7	.2	.6	.5	.6	.2
From cost-of-living-adjustments clauses	.9	.8	.3	.2	.3	.2	.1	.1	.4	.1

[1] Compensation includes wages, salaries, and employers' cost of employee benefits when contract is negotiated.

[2] Adjustments are the net result of increases, decreases and no changes in compensation or wages.

[3] Because of rounding total may not equal sum of parts.

p = preliminary

26. Average specified compensation and wage adjustments, major collective bargaining settlements in private industry situations covering 1,000 workers or more during 4-quarter periods (in percent)

Measure	Average for four quarters ending–							
	1984				1985			
	I	II	III	IV	I	II^p	III^p	IV^p
Specified total compensation adjustments, settlements covering 5,000 workers or more, all industries:								
First year of contract	4.8	4.7	4.2	3.6	3.4	3.5	3.1	(1)
Annual rate over life of contract	3.6	3.5	3.2	2.8	2.6	2.7	2.7	2.8
Specified wage adjustments, settlements covering 1,000 workers or more:								
All industries								
First year of contract	3.5	3.5	3.2	2.4	2.4	2.4	2.4	2.3
Contracts with COLA clauses	4.0	4.6	4.5	2.9	2.5	2.3	1.9	1.8
Contracts without COLA clauses	3.0	2.7	2.3	2.1	2.4	2.4	2.7	2.7
Annual rate over life of contract	3.0	3.1	2.8	2.4	2.3	2.4	2.5	2.7
Contracts with COLA clauses	2.6	2.9	2.8	1.8	1.3	1.5	1.8	2.5
Contracts without COLA clauses	3.4	3.2	2.8	2.7	2.8	2.8	3.0	2.8
Manufacturing								
First year of contract	2.6	3.0	2.6	2.3	2.1	2.0	1.5	.8
Contracts with COLA clauses	2.4	3.2	1.5	2.1	2.0	1.9	1.5	.8
Contracts without COLA clauses	2.9	2.8	3.7	2.9	2.5	2.2	1.5	.9
Annual rate over life of contract	2.8	3.1	2.8	1.5	1.4	1.5	1.6	1.9
Contracts with COLA clauses	2.2	2.8	1.8	1.0	.9	1.0	1.4	2.1
Contracts without COLA clauses	3.7	3.6	3.6	3.3	3.2	3.0	2.4	1.6
Nonmanufacturing								
First year of contract	3.8	3.7	3.3	2.5	2.6	2.7	3.2	3.3
Contracts with COLA clauses	4.9	5.2	5.4	5.5	5.1	4.3	4.0	3.6
Contracts without COLA clauses	3.0	2.6	2.1	2.0	2.4	2.5	3.0	3.3
Annual rate over life of contract	3.1	3.0	2.8	2.9	2.8	2.9	3.3	3.3
Contracts with COLA clauses	2.9	3.0	3.1	4.8	4.0	3.8	3.8	3.6
Contracts without COLA clauses	3.3	3.0	2.6	2.6	2.7	2.8	3.2	3.3
Construction								
First year of contract	1.2	.8	.9	.5	.9	1.1	1.0	1.5
Contracts with COLA clauses	.1	−.4	4.0	4.0	4.6	9.2	(1)	(1)
Contracts without COLA clauses	1.4	.9	.9	.4	.8	1.0	(1)	(1)
Annual rate over life of contract	2.0	1.7	1.4	1.0	1.4	1.7	1.7	2.1
Contracts with COLA clauses	.7	.0	1.4	1.4	1.7	4.6	(1)	(1)
Contracts without COLA clauses	2.2	1.8	1.4	1.0	1.4	1.7	(1)	(1)

p = preliminary

27. Average effective wage adjustments, private industry collective bargaining situations covering 1,000 workers or more during 4-quarter periods (in percent)

Effective wage adjustment	Average for four quarters ending–						
	1984			1985			
	II	III	IV	I	II[p]	III[p]	IV[p]
For all workers:[1]							
Total	4.3	4.2	3.7	3.6	3.5	3.5	3.3
From settlements reached in period	1.0	1.0	.8	.7	.9	.9	.7
Deferred from settlements reached in earlier period	2.2	2.1	2.0	2.2	1.9	1.8	1.8
From cost-of-living-adjustments clauses	1.1	1.2	.9	.7	.7	.8	.8
For workers receiving changes:							
Total	5.3	5.0	4.4	4.5	4.2	4.3	4.1
From settlements reached in period	3.6	3.7	3.0	2.9	2.9	2.8	3.4
Deferred from settlements reached in earlier period	4.9	4.2	4.0	4.2	3.9	3.7	3.7
From cost-of-living-adjustments clauses	4.0	3.2	2.7	2.3	2.3	2.8	2.2

[1] Because of rounding total may not equal sum of parts.

[p] = preliminary

28. Specified compensation and wage adjustments from contract settlements, and effective wage adjustments, State and local government collective bargaining situations covering 1,000 workers or more (in percent)

Measure	Annual average		Second 6 months 1985[p]
	1984	1985	
Specified adjustments:			
Total compensation[1] adjustments,[2] settlements covering 5,000 workers or more:			
First year of contract	5.2	4.2	3.8
Annual rate over life of contract	5.4	5.2	5.3
Wage adjustments, settlements covering 1,000 workers or more:			
First year of contract	4.8	4.6	4.4
Annual rate over life of contract	5.1	5.4	5.6
Effective adjustments:			
Total effective wage adjustment[3]	5.0	5.8	4.1
From settlements reached in period	1.9	4.1	3.2
Deferred from settlements reached in earlier periods	3.1	1.6	.9
From cost-of-living-adjustment clauses	([4])	([4])	([4])

[1] Compensation includes wages, salaries, and employers' cost of employee benefits when contract is negotiated.

[2] Adjustments are the net result of increases, decreases and no changes in compensation or wages.

[3] Because of rounding total may not equal sum of parts.

[4] Less than .05 percent.

[p] = preliminary

29. Work stoppages involving 1,000 workers or more

Measure	Annual totals		1985												1986
	1984	1985	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.[p]	Sept.[p]	Oct.[p]	Nov.[p]	Dec.[p]	Jan.[p]
Number of stoppages:															
Beginning in period	62	-	2	4	4	3	2	2	9	6	11	4	2	2	-
In effect during period	68	-	9	13	12	8	8	8	13	16	20	16	11	8	-
Workers involved:															
Beginning in period (in thousands)	376.0	-	4.7	29.3	15.2	6.2	6.9	15.7	52.3	15.3	68.5	74.6	25.0	8.2	-
In effect during period (in thousands)	391.0	-	16.0	43.9	48.2	14.1	14.8	28.5	60.2	66.8	90.9	117.3	64.6	38.1	-
Days idle:															
Number (in thousands)	8,499.0	-	278.3	259.3	698.5	229.5	203.3	454.3	500.2	868.7	931.4	1,433.0	651.2	665.4	-
Percent of estimated working time[1]	.04	-	.01	.01	.03	.01	.01	.02	.02	.03	.04	.06	.03	.03	-

[1] Agricultural and government employees are included in the total employed and total working time; private household, forestry, and fishery employees are excluded. An explanation of the measurement of idleness as a percentage of the total time worked is found in "Total Economy" Measure of Strike Idleness, *Monthly Labor Review*, October 1968, pp. 54-56.

[1] Area is generally the Standard Metropolitan Statistical Area (SMSA), exclusive of farms. L.A.-Long Beach, Anaheim, Calif. is a combination of two SMSA's, and N.Y., N.Y.-Northeastern N.J. and Chicago, Ill.-Northwestern Ind. are the more extensive Standard Consolidated Areas. Area definitions are those established by the Office of Management and Budget in 1973, except for Denver-Boulder, Colo. which does not include Douglas County. Definitions do not include revisions made since 1973.

[2] Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

M - Every month.

1 - January, March, May, July, September, and November.

2 - February, April, June, August, October, and December.

[3] Regions are defined as the four Census regions.

The population size classes are aggregations of areas which have urban population as defined:

A-1 - More than 4,000,000.

A-2 - 1,250,000 to 4,000,000.

B - 385,000 to 1,250,000

C - 75,000 to 385,000.

D - Less than 75,000.

Population size class A is the aggregation of population size classes A-1 and A-2.

– Data not available.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Because each local index is a small subset of the national index, it has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error than the national index. As a result, local area indexes show greater volatility than the national index, although their long-term trends are quite similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in escalator clauses.

32. Annual data: Consumer Price Index all items and major groups

Sweden	-	-	-	-	-	-	-	-	-

[1] Quarterly rates are for the first month of the quarter.

[2] Major changes in the Italian labor force survey, introduced in 1977, resulted in a large increase in persons enumerated as unemployed. However, many persons reported that they had not actively sought work in the past 30 days, and they have been provisionally excluded for comparability with U.S. concepts. Inclusion of such persons would more than double the Italian unemployment rate shown.

- Data not available.

NOTE: Quarterly and monthly figures for France, Germany, and Great Britain are calculated by applying annual adjustment factors to current published data and therefore should be viewed as less precise indicators of unemployment under U.S. concepts than the annual figures.

46. Annual data: Employment status of the civilian working-age population, ten countries

---

[1] Total cases include fatalities.

[2] The incidence rates represent the number of injuries and illnesses or lost workdays per 100 full-time workers and were calculated as: (N/EH) X 200,000, where:

N = number of injuries and illnesses or lost workdays.

EH = total hours worked by all employees during calendar year.

200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year.)

[3] Excludes farms with fewer than 11 employees since 1976.

– Data not available.

New from BLS

SALES PUBLICATIONS

BLS Bulletins

Employment and Wages, Annual Averages 1984. Bulletin 2249, 524 pp., $20 (GPO Stock No. 029-001-02861-0). Presents complete count of employment and wages for workers covered by unemployment insurance programs during 1984. BLS compiles data on a national basis, by State, and by industry. Coverage extends to the District of Columbia, Puerto Rico, and Virgin Islands.

Area Wage Surveys

These bulletins cover office, professional, technical, maintenance, custodial, and material movement jobs in major metropolitan areas. The annual series of 70 is available by subscription for $102 per year. Individual area bulletins are also available separately.

Chattanooga, Tennessee-Georgia, Metropolitan Area, September 1985. Bulletin 3030-40, 29 pp., $1.75 (GPO Stock No. 829-001-00040-3).

Columbus, Ohio, Metropolitan Area, October 1985. Bulletin 3030-51, 39 pp., $1.75 (GPO Stock No. 829-001-00051-9).

Gainesville, Florida, Metropolitan Area, September 1985. Bulletin 3030-42, 23 pp. $1.25 (GPO Stock No. 829-001-00042-0).

Indianapolis, Indiana, Metropolitan Area, October 1985. Bulletin 3030-50, 40 pp., $1.75 (GPO Stock No. 829-001-00050-1).

Kansas City, Missouri-Kansas, Metropolitan Area, September 1985. Bulletin 3030-46, 53 pp., $2.25 (GPO Stock No. 829-001-00046-2).

Miami, Florida, Metropolitan Area, October 1985. Bulletin 3030-47, 38 pp., $1.75 (GPO Stock No. 829-001-00047-1).

New Orleans, Louisiana, Metropolitan Area, October 1985. Bulletin 3030-49, 33 pp., $1.50 (GPO Stock No. 829-001-00049-7).

Periodicals

CPI Detailed Report. Each issue provides a comprehensive report on price movements for the month, plus statistical tables, charts, and technical notes. $4 ($25 per year).

Current Wage Developments. Each issue includes selected wage and benefit changes, work stoppages, and statistics on compensation changes. $2 ($21 per year). November issue features major collective bargaining settlements in private industry, first 9 months of 1985.

Employment and Earnings. Each issue covers employment and unemployment developments in the month plus regular statistical tables on national, State, and area employment, hours, and earnings. $4.50 ($31 per year).

Producer Price Indexes. Each issue includes a comprehensive report on price movements for the month, plus regular tables and technical notes. $4.25 ($29 per year).

OTHER PUBLICATIONS

(Single copies available upon request while supplies last.)

Current BLS Publications (September 1985). 15 pp. Catalog of BLS publications in print. Includes ordering information.

Area Wage Summaries

Ann Arbor, MI. October 1955. 5 pp.
Madison, WI. September 1985. 4 pp.
Northwest Texas, September 1985. 3 pp.

BLS REPORTS

Employment in Perspective: Minority Workers, Third Quarter 1985. Report 724. 4 pp. Focuses on differences in the work experience of black, Hispanic, and white workers over the entire year of 1984.

Employment in Perspective: Women in the Labor Force (formerly called Working Women), Third Quarter 1985. Report 725. 3 pp. Describes women's employment situation in the third quarter and summarizes information on women who are self-employed.

Major Programs, Bureau of Labor Statistics. Report 718. Presents in highly concentrated form the scope of the Bureau's major statistical programs, the data available, the form of publication, some of the uses of the data, and selected publications and data tapes.

BLS Summaries

Occupational Earnings in Banking, Selected Metropolitan Areas, 1985. Summary 85-11 (No. 1 of 2). 6 pp.

Occupational Earnings in Selected Areas, 1985. Summary 85-12 (No. 2 of 3). 7 pp.

To Order:

Sale Publications: Order bulletins by title, bulletin number, and GPO stock number from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, or from the Bureau of Labor Statistics, Publications Sales Center, P.O. Box 2145, Chicago, IL 60690. Subscriptions, including microfiche subscriptions, are available only from the Superintendent of Documents. Do you sometimes feel like Stanley hunting for Livingstone, when confronted with the maze of economic and social statistics?

If so, your search for a single source of reliable and comprehensive statistics and analysis is over. Subscribe to the *Monthly Labor Review*, the oldest government journal providing up-to-date information in economic and social statistics.

Published continuously since 1915, the *Review* provides a 47-page section of current statistics covering employment and unemployment; wages, and strike activity; worker and capital productivity; unit labor costs and output; consumer, industrial, and international prices; economic growth; and related topics. Each month, the *Review* also contains articles and informative reports. Some recent titles are:

- Job Training and Partnership Act
- Older workers in the labor market
- Japan's low unemployment
- Employee-owned firms
- The labor force in 1995
- Multifactor productivity
- Import prices for petroleum
- The employment cost index
- Work injuries from falls
- Youth joblessness
- Men's and women's earnings
- Occupational winners and losers
- Black workers' gains
- Shortage of machinists?
- Price inflation remains low
- Employment in energy industries
- Collective bargaining
- Fatal injuries

To subscribe to the Review, please fill out the following coupon and send to:

MONTHLY LABOR REVIEW

APRIL 1986
VOLUME 109, NUMBER 4

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

S. Meister, T. A. Sherman 3 **Import, export prices reflect declining dollar and oversupply**
Import prices rose in fourth-quarter 1985 as effects of weakening dollar were felt; export prices were held down by competition and oversupplies

C. Howell and A. Clem 17 **Inflation remained mild again during 1985**
Consumer prices rose by less than 4 percent, about the same as during 1982–84; the rate of increase for producer prices of finished goods was less than 2 percent

J. Borum and J. Conley 22 **Wage restraints continue in 1985 major contracts**
Wage adjustments were low for the fourth year in a row; many contracts featured 'back-loading,' lump-sum payments, and two-tiered systems

Wayne J. Howe 29 **The business services industry sets pace in employment growth**
Industries which provide services to business for a fee or on a contractual basis have had rapid employment gains, especially firms supplying data processing services

M. L. Carey, K. L. Hazelbaker 37 **Employment growth in the temporary help industry**
The number of employees rose by 70 percent from November 1982 to November 1984, making the industry the fastest growing among those with employment over 50,000

Labor Month In Review

COMPETITIVENESS. Can America balance human values with industries' need to remain competitive? National leaders from business, labor, and academia addressed that question on March 5, at a Washington, D.C., conference cosponsored by the George Washington University and the U.S. Department of Labor. Professors Thomas A. Kochan and Robert McKersie of the Massachusetts Institute of Technology and Richard E. Walton of Harvard University helped lead the discussion. Excerpts:

Human values (Kochan). Democratic societies face the dual challenge of achieving competitiveness while at the same time attending to the human values of their citizens. In the 1930's, American policymakers addressed this challenge by enacting legislation supporting collective bargaining, minimum wages, unemployment compensation, and so forth. Later legislation covered occupational safety and health, equal employment opportunity, and pension security. Over the years, these policies were supported by economic and trade policies that promoted expansion of world and domestic markets. This encouraged the development of private collective bargaining and human resource management practices that provided management with the stability needed to capture expanding market opportunities and labor with the means to share in the benefits of economic growth.

But the intensified competitive pressures experienced by many American firms and industries in recent years have raised questions about the ability of management and labor to meet this dual challenge within the existing policy framework and the institutional practices that have evolved since the 1930's.

One of the hallmarks of collective bargaining has always been its capacity to adapt to different market settings in ways that "took wages out of competition." This stimulated American management to search for strategies that gave their businesses a comparative advantage on bases other than being the lowest wage rate competitor. One of the pressures for change in industrial relations in recent years is that, given the growth of international competition and the rise of domestic nonunion competition, collective bargaining has experienced difficulty in performing this function. Some employers have responded to this situation in the short run by decentralizing bargaining structures, shifting wage criteria to focus more directly on local ability to pay, and demanding wage concessions and work rule changes in an effort to close the gap in labor costs with their competitors.

Employment security (McKersie). If the twin objectives of competitiveness and human values are to be linked in a constructive manner, then employment security is one of the most important themes for achieving this integration. Certainly, if either objective is pursued without reference to the other, then significant distortions emerge in the social fabric and economic relations in the United States. For example, if employers seek to realize shortrun cost savings, they may be prompted to "dump" large numbers of workers (often older workers) into the labor market and pursue aggressive restructuring that ignores the human costs that are involved. On the other hand, if workers (and especially their union representatives) are able to exercise bargaining power to the point that they achieve job protection, of the sort that has existed for long periods of time in the railroad industry, then the enterprise as well as generations of potential workers (and indirectly the communities involved) suffer the consequences of protection at the price of economic viability.

Clearly, the "best way" is to realize a balance and to fashion concepts, principles, and programs that bring about a creative synthesis of competitiveness and human values.

Commitment (Walton). When we think of commitment in the workplace we usually focus on worker commitment to the organization and the benefits of this commitment for competitiveness. Is it not also true that additional worker commitment to the welfare of the employing organization must be matched by additional organizational commitment to the employees' welfare?

The commitment of workers to the enterprise can take many forms, including initiatives to improve quality, reduce scrap and other waste, and increase the productivity of their labor.

Similarly the enterprise's commitment to workers can be expressed in a variety of policy areas—strong employment assurances, meaningful opportunities to participate in decisions, provisions for training and retraining, information, challenging jobs, and a management style that treats workers as adults.

How is *union* commitment to the success of the enterprise reciprocated? Does it not imply commitment by the management of the enterprise to respect the union as an institution? If so, what actions and institutional forms express the reciprocal commitments of management and unions to the other?

If workers and unions are to accept more responsibility for the competitiveness of the enterprise and exercise more influence within it they will require more timely information. If workers make economic sacrifice to keep the enterprise competitive, new principles governing economic sharing must be developed.

Information about the conference is available from the Bureau of Labor-Management Relations and Cooperative Programs, Room N5416, U.S. Department of Labor, Washington, D.C. 20210 ☐

Import, export prices reflect declining dollar and oversupply in 1985

After falling during the first three quarters of the year, import prices rose as the effects of the weakening dollar were finally felt; meanwhile, fierce competition and oversupply forced down U.S. export prices

SHELLEY MEISTER AND THOMAS A. SHERMAN

U.S. import prices, as measured by the BLS International Price Program, continued to fall in 1985, marking their third consecutive year of decline. The 1.1-percent decrease for the year followed a 1.5-percent drop in 1984. Most of the 1985 decline was registered in the first quarter, when import prices fell 2.3 percent. The dollar's depreciation moderated import price decreases in the second and third quarters, and contributed to a 1.8-percent price rise for imports during the fourth quarter. (See chart 1.)

During 1985, price increases for imports of finished goods and food could not offset declines for raw materials and intermediate goods. Prices rose 4.2 percent for machinery and transport equipment, 0.8 percent for miscellaneous manufactured goods, and 4.8 percent for food. Prices for beverages and tobacco also rose 3.3 percent for the year. However, decreases were recorded in the other four components of the all-import price index. Energy, intermediate goods, and crude material prices were down 6.0 percent, 2.5 percent, and 7.8 percent, respectively. The fats and oils index, which represents only 0.2 percent of the all-import index, plunged 56.0 percent. These declines are largely attributable to oversupplies of basic commodities, such as crude petroleum, rubber, steel, and certain nonferrous metals.

The U.S. dollar reached an all-time high in March 1985, and then began a gradual decline, falling 9 percent by September. In late September, the decline was accelerated after a group of the Nation's major trading partners agreed to intervene in the foreign exchange market to curb the dollar's strength. The immediate effect was a further 5.1-percent decline in the value of the dollar, bringing the total drop to 13.6 percent for the year.[1]

Product areas in which the major industrialized nations supply a large percentage of U.S. imports appeared particularly susceptible to last year's changes in exchange rates. For example, the machinery and transport equipment index, which accounted for nearly 40 percent of total imports in 1985, declined 1.3 percent in the first quarter of 1985. However, as the dollar began to fall, import prices rose modestly in the middle of the year, and then jumped 3.6 percent in the fourth quarter, the strongest quarterly advance in 4 years.

The dollar's decline did not immediately affect all import prices. Some suppliers deferred price increases to see if the dollar's downward trend would be sustained. In other cases, traders were bound to long-term supply contracts and thus could not adjust prices immediately. Also, the dollar re-

mained strong against some currencies, especially those of Mexico and Latin America. For example, the Mexican peso depreciated 54.3 percent against the U.S. dollar in 1985.[2] Meanwhile, the currencies of Canada and some of the newly industrialized nations of the Far East depreciated slightly against the dollar last year. All of these factors contributed to the record $361 billion of foreign goods imported by the United States in 1985.[3] That was 6.0 percent greater than the previous record high set in 1984.

U.S. export prices declined in 1985 for the second year running. The 1.3-percent drop nearly matched the 1.4-percent decline observed in 1984. (See chart 2.) Major declines occured in the indexes for crude materials (−8.1 percent), energy (−3.1 percent), and agricultural products (−3.0 percent). The fats and oils index plummeted 31.4 percent but this index represents less than 1 percent of U.S. export trade. Declines of 1.2 percent, 1.1 percent, and 2.7 percent were registered for intermediate manufactured goods, chemicals, and beverages and tobacco. Moderating these declines were a 1.3-percent price increase for machinery and transport equipment and a 1.0-percent advance for miscellaneous manufactured goods.

Many of the same factors that caused import prices to decrease also held down export prices. Excess global stocks of food, crude materials, and fats and oils depressed prices for those commodities. The strong competition encountered by U.S. exporters, especially from producers in the Far East, kept any price increases to a minimum. Also, the strength of the U.S. dollar continued to have a dampening effect on export prices, despite the weakening during the last three quarters of the year. Although U.S. export prices dropped, the Nation's export volume was down in 1985. U.S. exporters shipped $213 billion in merchandise, or 2.2 percent less than the previous year's total.[4]

The Nation's merchandise trade deficit hit a record $148.5 billion in 1985,[5] 16 percent above the 1984 total. (See chart 3.) The largest U.S. merchandise trade deficit was held with Japan—$49.75 billion, up 35 percent from 1984. The Nation also had significant trade deficits with Canada, Taiwan, and West Germany of $22.2 billion, $13.1 billion, and $12.2 billion respectively.[6] In contrast, the United States continued to maintain a healthy trade surplus of $21.4 billion in the service sector.[7] Service trade includes income of U.S. foreign subsidiaries. The dollar's 1985 decline tended to push up earnings in this area.[8]

The strong dollar has been a major cause of the trade deficit. Although the real value of the trade-weighted dollar declined 13 percent between March and December 1985, at yearend it remained 32 percent higher than its July 1980 low.[9] (See chart 4.) Roughly one-third of the recent drop in the trade-weighted dollar followed the historic "Group of Five" meeting on September 22 in New York, at which

[2] Data not available.

n.e.s.=not elsewhere specified.

Japan, West Germany, the United Kingdom, and France agreed to cooperate in a plan to force down the value of the dollar through intervention in foreign exchange markets. As of December, however, this decline had not retarded U.S. imports or stimulated exports, as the record trade deficit showed.

Another reason for the large trade deficit has been the rapid industrialization of Far Eastern nations following in Japan's footsteps. Besides the massive trade deficit with Japan, the United States also ran large trade deficits with other nations in the Far East. The combined trade surplus of South Korea, Taiwan, Hong Kong, and Singapore with the United States reached an estimated $25 billion in 1985.[10] These nations are aggressively entering automobile, consumer electronics, and semiconductor markets.[11] This has led to lower prices for many of these goods on world markets.

The Latin American debt problem also had a negative effect on U.S. foreign trade in 1985. It is estimated that the region's total foreign debt will reach $360 billion for the year.[12] Brazil is most heavily in debt, owing $100 billion, with Mexico not far behind at $97 billion.[13] All the debtor nations need hard currency to repay loans from Western banks and The International Monetary Fund. In an effort to obtain the currency, these countries have curtailed imports, which has dramatically hurt U.S. export trade. U.S. exporters to Latin America are further hampered by the appreciation of the dollar against many of these nations' currencies.

Price developments discussed in this article are based on data from the BLS International Price Program. That program produces import and export price indexes based on the Standard Industrial Trade Classification scheme. Both indexes use a modified Laspeyres formula. Price data are collected for more than 14,000 products, and are not seasonally adjusted. Import price indexes are weighted by the 1980 Tariff Schedule of the United States Annotated (TSUSA). Export price indexes are weighted using the 1980 Schedule B classification system of the U.S. Bureau of the Census. In addition, the International Price Program, in 1985, also started producing SIC-based indexes and Bureau of Economic Analysis "end-use" price indexes.

Import price developments

Energy. The decline in world energy prices continued to lower U.S. import prices. This was reflected in the price index for imported fuels and related products, which decreased 6.0 percent for the year after a 3-percent drop in 1984. This index comprises 32.78 percent of the all-import index. The crude petroleum index fell 3.8 percent and the natural gas index decreased 23.9 percent. (These two index movements represent prices through November 1985.)

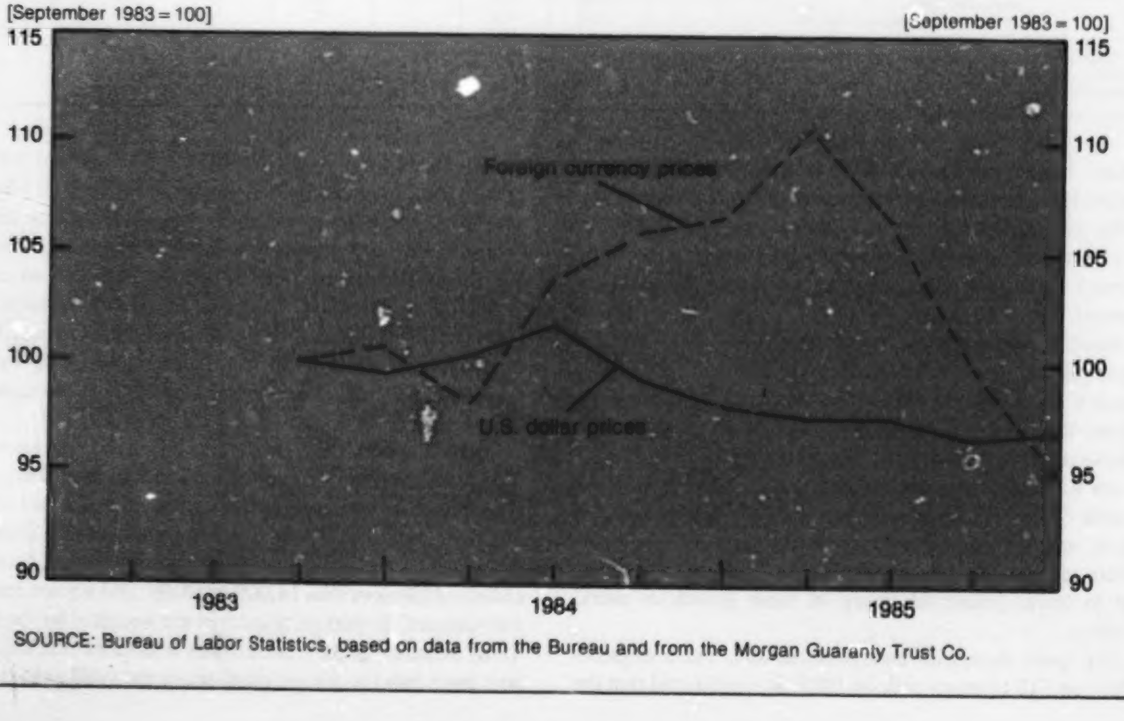
U.S. average monthly imports of crude oil and petroleum products declined 7 percent from their 1984 level, and 27 percent since August 1980.[14] (See chart 5.) Much of this decrease can be attributed to greater fuel efficiency in automobiles and a switch from crude oil to coal and natural gas by many industrial consumers.[15] The decline in U.S. crude oil imports has greatly affected many OPEC nations, especially Saudi Arabia. From 325 thousand barrels of crude oil a day in 1984, Saudi Arabian imports had declined to 167 thousand barrels a day by 1985. Total U.S. imports of OPEC crude oil in 1985 were 1,825 thousand barrels a day, down 11 percent from 1984 and 58 percent from 1980.[16]

Since 1982, the United States' major source of foreign crude and petroleum products has been non-OPEC producers. Imports of crude oil and petroleum products from these nations were 23 percent greater in 1985 than in 1980, but were down 5 percent from 1984 levels. The number of barrels of Canadian and Mexican crude imports increased during 1985, but imports of U.K. crude fell 22 percent over the year.[17]

In September, OPEC representatives met in Switzerland and decided to drop the cartel's official price 50 cents per barrel for heavy crude and 20 cents per barrel for medium crude. The cartel's previous official price of $26.50 a barrel for heavy crude had been $2 above the spot market price.[18] Saudi Arabia was the only OPEC member to actually sell heavy crude for that amount. As a result, in July, Saudi output hit its lowest production level in 20 years. For several years, the other OPEC members have routinely sold their crude at a discount or through barter agreements and so have captured potential Saudi Arabian sales.[19]

As of October 1, 1985, Saudi Arabia decided that it was no longer going to follow the cartel's official prices. In order to get production up, Saudi Arabia began the practice of "net-backing" prices. This involves the linking of crude oil prices to those of refined products. With Saudi Arabia cutting prices to some $2 below the official cartel price, that nation's production increased to 4.2 million barrels a day

Chart 2. Quarterly indexes of U.S. dollar and foreign currency prices for U.S. exports, 1983-85



SOURCE: Bureau of Labor Statistics, based on data from the Bureau and from the Morgan Guaranty Trust Co.

from 2 million barrels a day. At year's end, Sheik Yamani, the Saudi Arabian oil minister, announced plans to keep production at the higher levels even if it forced prices below \$20 a barrel, which it did in January 1986.[20]

Most non-OPEC oil producing nations cut their prices for crude throughout 1985. In November, however, Mexico and two Canadian companies increased their prices for crude oil. Since 1983, Mexico had conformed to OPEC pricing and production policies. This situation existed until July 1985, when that country cut its prices for Isthmus light crude by \$1.24 and for heavy crude by 77 cents a barrel.[21] But in November, Mexico responded to a firming up of oil prices and increased demand for light crudes by raising the price of its Isthmus light crude by 76 cents. In the same month, Canada's Imperial Oil Ltd. and Petro Canada raised their prices for Alberta 40-degree light crude oil by \$1.58 and \$1.20 respectively.[22] Throughout November, crude oil prices rose on the spot market as oil companies kept inventories low in expectation of price decreases in December or early 1986. At that time, the full impact of Saudi Arabia's increased production was expected to cause a glut of oil on the world market.

By December, U.S. stocks of heating oil for the winter season were at an all-time low. Because domestic refineries had extra capacity and foreign heating oil was available, there was no concern about a shortage in heating oil when seasonal demand picked up.[23] However, spot market prices for heating oil had increased in the last half of the year. In July, heating oil was selling on the spot market for \$28.50/bbl, but by the end of November, the price had reached \$38.50/bbl.[24] This resulted from high European demand, and the fact that the Europeans were offering a premium to refiners. In September, inventories were 18 million barrels below 1984 levels and just 13 million barrels above spot shortage levels.[25]

During the winter of 1984–85, U.S. natural gas use was 1.9 percent below the previous year's levels. The forecast for winter 1985–86 is for an increase in natural gas consumption in the 3-percent range, with a concomitant growth in imports of 0.04 trillion cubic feet.[26] Practically all of the increase in imports will be coming from Canada.

From 1975 to 1984, Canadian natural gas prices were set by the government. However, in November 1984, Canada started deregulating natural gas prices, with the wholesale price of natural gas in Toronto serving as the benchmark for sales to the United States. Prices fell as a result of the deregulation, and Canadian natural gas exports to this country increased.[27] Further deregulation in November 1985 was designed to help Canadian producers become price competitive with Western U.S. natural gas producers. According to Canadian law, an exporter cannot sell natural gas to the United States at prices below those offered to purchasers in neighboring provinces. Still, at a floor of \$2.19 per thousand cubic feet, yearend 1985 prices were 26 percent less than the previous Toronto benchmark price.[28]

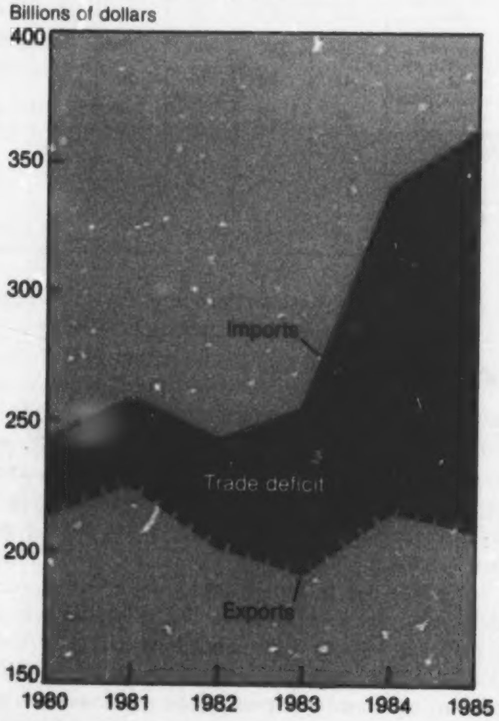
Machinery and transport equipment. Prices for imported machinery and transportation equipment were up 4.2 percent in 1985, after slipping 1.2 percent in 1984. (See chart 6.) This index is heavily influenced by fluctuations in the value of the U.S. dollar. Much of the machinery and transportation equipment imported to the United States comes from Japan and West Germany, nations whose currencies appreciated against the dollar in 1985. The weakening of the dollar was reflected in the rise of the index through the last three quarters of the year.

The index for imported machinery and transportation equipment represents 25 percent of the all-import index. In 1985, the value of these imports reached \$141.7 billion, up from \$123.1 billion the previous year.[29] As the U.S. economy continued to expand, albeit at a slower rate than in 1984, domestic demand for capital goods such as looms, lathes, pumps, and pistons, and for consumer items such as vehicles, video cassette recorders, and microwave ovens, continued to grow. Much of this demand was met by imports. Indeed, import penetration in the U.S. machinery, electronics, and mechanical components markets has been growing steadily for more than a decade.[30]

Import penetration in the automobile industry also increased in 1985. Despite Detroit's big late summer sales campaign, both Japan and West Germany managed to capture larger shares of the domestic market. Overall, car and truck sales hit record highs, with total units sold reaching 15.7 million.[31] Of these, 74.3 percent were American made, 20.2 percent Japanese, and 3.8 percent German. Comparable 1984 shares were 76.5, 18.4, and 3.3 percent respectively.[32]

The ceiling on the voluntary restraint agreement covering Japanese auto exports to the United States was raised substantially in April of last year. From April 1984 to April 1985, Japanese manufacturers had limited auto shipments to the United States to 1.85 million units. In April 1985, however, they announced that they would raise the yearly limit to 2.3 million vehicles. As a result, Japanese auto shipments to this country as of October 1985 were 36 percent greater than comparable 1984 figures.[33] The yearend strengthening of the yen prompted Japanese producers to raise prices, but analysts doubt this will stem strong sales gains.[34]

Chart 3. Annual volume of U.S. exports and imports of merchandise, 1980-85



SOURCE: U.S. Department of Commerce.

With fuel costs no longer rising rapidly, and disposable incomes increasing, U.S. demand for larger, more luxurious cars has risen in the last few years. The Japanese have altered their import product mix to reflect this change in tastes. With supply limited by the voluntary export restraints, Japanese auto makers have improved comfort and performance features in order to raise prices and profits.[35] This is not completely reflected in the automobile import index, which tracks a fixed basket of automotive styles and factors out price increases due to quality changes in the products priced. Thus the index advanced 6.1 percent for 1985, mirroring moderate price increases for comparable base models. Consumers, however, saw higher prices, and sportier cars, in dealer showrooms.

In recent years, domestic auto makers have responded to increased competition by cutting costs, modernizing plant and equipment, and forming joint ventures with their Japanese rivals. These joint ventures will provide U.S. manufacturers firsthand exposure to Japanese production, inventory, and managerial techniques which have made them leaders in small car production. In turn, the Japanese gain a solid foothold in the lucrative U.S. market. Should the U.S. Congress enact domestic content or import quota legislation, the Japanese will continue to profit from the estimated 1.2 million vehicles that the joint ventures will produce annually in this country by the end of the decade.

Electrical machinery and equipment imports decreased in volume and price last year. U.S. firms imported $18.2 billion worth of these goods in 1985, a 3.3-percent drop from 1984.[36] The import price index for this product group fell 3.6 percent for the year, continuing its downward trend.

Semiconductors constitute roughly 40 percent of the weight of this index. Spurred by increases in spending on personal computers, home electronics, aerospace, and defense in 1984, electronics components manufacturers here and abroad churned out millions of memory chips, transistors, rectifiers, and similar devices. Advances in technology and increasing economies of scale resulted in sizable per-unit cost savings for these products. The explosion in personal computer spending eased in 1985, however, leaving semiconductor supply far ahead of demand. This glut has depressed prices worldwide, causing the import price index for electrical components to fall 14.6 percent for 1985. The glut is expected to last well into 1986.[37] Prices for some specialty items and memory devices began rising late in 1985 as inventories were slowly depleted and buyers feared possible shortages in the spring.[38] In addition, Japanese firms raised their semiconductor prices late in 1985 in response to allegations by the U.S. industry that Japanese goods were being sold in this country at less than cost.[39] The yen's appreciation against the dollar in the fourth quarter also contributed to the price increases. These factors, however, were not enough to reverse the index's downward trend.

Price increases were welcome news to U.S. chip makers. In recent years they have been operating under ever lower price ceilings imposed by the large volume of Japanese chips on world markets. For example, one estimate puts Japan in control of 90 percent of the world market for 256K dynamic RAM chips.[40] Domestic chip manufacturers suffered heavy losses and many plants were closed this past summer.[41]

Computer and automated data processing equipment sales growth slowed markedly in 1985, after 25-percent annual growth in the previous 3 years.[42] Some sectors of the market, such as personal computers, actually suffered sales declines.[43] A slowdown in capital spending by the manufacturing sector, which usually accounts for a third of computer sales, and uncertainty surrounding tax reform and its effect on investment contributed to the sales slump.[44] In addition, many of the computers already in use have not delivered promised increases in productivity, which has tended to slow investment in new equipment.[45] Overall, import prices rose 1.6 percent for the year. Prices rebounded modestly in the last half of the year as the dollar weakened against the currencies of our major suppliers, primarily the Japanese.

Prices of imported metalworking and machine tool equipment rose strongly in 1985, boosting the index for those goods 9.1 percent. Buyers stressed reliability, fast delivery, and good service among their reasons for selecting imports over domestic equipment.[46] Indeed, imports rose 23 percent over the first three quarters of the year, capturing over half the U.S. market.[47] Because Japan is America's main supplier of foreign made machine tools, the yearend strengthening of the yen increased prices substantially.

New orders placed with U.S. machine tool manufacturers declined 13.2 percent in 1985,[48] further evidence of the failure of the manufacturing sector to expand in line with the economy as a whole. The curtailing of Federal investment tax credits and the lengthening of depreciation schedules also has made domestic producers apprehensive, as they feel such changes could stall economic growth throughout industry.

Food. Prices for imported food rose 4.8 percent in 1985 after the previous year's decline of 2.3 percent. This index makes up roughly 6.6 percent of the all-import price index. Price increases for coffee, tea, and cocoa and for fruits and vegetables were offset by price declines for meat, sugar, and fish. In fiscal 1985, U.S. food imports were valued at $19.77 billion. Because of declining agricultural exports, the Nation's agricultural trade surplus shrank from $19.10 billion in fiscal 1984 to $11.42 billion in fiscal 1985.[49]

After three quarters of modest declines, imported coffee prices soared 26.4 percent in the last quarter of 1985. This resulted in a 16.7-percent increase in coffee prices for the year. However, U.S. coffee consumption was down from 1.99 cups per person per day in 1984 to 1.83 cups per day.

Last year was also the first year that more soft drinks were consumed than coffee.[50]

The International Coffee Organization (ICO), which is composed of both producing and consuming nations, had increased the export quotas for producing nations in 1984 to 61 million bags. These more liberal quotas may have resulted in the large glut of coffee on the market and an 8-percent reduction in coffee prices over the first three quarters of 1985. The 1984 ICO agreement was intended to keep coffee prices between $1.20 and $1.40 a pound,[51] but by September 1985 the price was down to $1.17 a pound.[52] This prompted the ICO to decrease the quota to 58.0 million bags.[53] This, and more importantly, news of a Brazilian drought in the summer of 1985 sent coffee prices soaring at the end of the year.

Tea prices were on a steep decline in 1985, as an exceptionally good 1984 harvest in Sri Lanka yielded plentiful supplies. Unfortunately, the 1985 Sri Lankan tea crop was of a poor quality because of heavy rains during the growing season. The 1985 harvest was predicted to be 208 million kilos, the smallest crop since 1960.[54] The shortfall in supply is expected to drive up the price of teas in 1986.

In fiscal 1985, the quantity of tea imported by the United States decreased 8 percent from the previous year's level.[55] Demand in this country centers upon the lower priced teas and herbal teas. Thus Argentina, a grower of lower priced teas, exports more of the commodity to the United States than do traditional suppliers such as Indonesia. Tea consumption in the United States declined 2 percent for the year, as cooler weather in the spring and a late summer reduced consumption of iced tea, the most popular form of the product consumed in this country.[56]

Cocoa prices were also down in 1985. The Ivory Coast, Brazil, Malaysia, Ecuador, and Indonesia all had harvests of record proportions during crop year 1984–85. Because of these developments and prospects of an equally large 1985–86 harvest, cocoa prices for the first three quarters of 1985 fell to $2,155 per ton from $2,342 per ton in calendar 1984.[57]

In 1985, prices for imported meat continued their decline. The meat import price index decreased 0.8 percent after the previous year's 1.3-percent drop. Although cow slaughter was down in 1985, the weights of U.S. cattle reached a record level.[58] This caused higher than expected domestic beef supplies, and thus sharp declines in imported meat prices, especially early in the year.[59] This situation was corrected by the fourth quarter of the year.

More beef exports come to this country than to any other. However, in recent years, meat imports have leveled off because of the strength of the U.S. Meat Import Law, a lowering of the amount of exportable beef worldwide, and agreements with foreign beef producers to reduce their exports to this country.[60] In 1985, the amount of meat imported into the United States increased only 4.0 percent.[61] Pork imports were 1,128 million pounds, up 15 percent from 1984.[62] Canada and Denmark should account for the greatest increase in pork exports to the United States.

Sugar and sweetener import prices decreased 5.6 percent in 1985. The United States imports one-third of all the sugar that it consumes.[63] The leading sugar exporters are Cuba, the European Community (EC), Australia, Brazil, and the Philippines. In recent years, there has been an oversupply of sugar on the world market. Much of the large buildup of sugar stocks can be traced to policies of the EC. Prior to 1977, the EC was a net importer of sugar, but because of increased production and export subsidies, the Community has now become a net sugar exporter.

U.S. demand for sugar has been decreasing in recent years as high fructose corn syrup (HFCS) and artificial sweeteners are substituted for sugar. Total domestic demand in 1985 is expected to be 8 million tons, 6 percent less than the amount consumed in 1984.[64] In 1981, the United States established quotas for imports of sugar, because their cheaper price was detrimental to domestic producers. The 1985 quota was reduced to 1.8 million tons from 2.5 million tons.

Miscellaneous manufactures. The import price index for

SOURCE: U.S. Department of Energy, Energy Information Administration.

miscellaneous manufactured articles rose 0.8 percent in 1985, having declined a scant 0.1 percent in 1984. A 2.9-percent decrease in clothing prices could not offset the increases recorded for footwear; professional, controlling, and scientific instruments; and photographic instruments and supplies.

The U.S. Congress passed a bill in late 1985 that would have restricted imports of textiles, apparel, and footwear. The bill was designed to maintain imports' share of the U.S. textile and apparel market at the level they would have held had the 1974 Multi-Fiber Arrangement been strictly enforced. It is estimated that Far East exporters have increased shipments to the United States 19 percent over the past 4 years.[65] The textile bill, which would have reduced imports by 40 percent, was vetoed by President Reagan in late December. Prior to the veto, however, some of the smaller foreign manufacturers were cutting prices to acquire a larger market share before the proposed quotas could take effect. Also, there were reports of overproduction by South Korean apparel manufacturers.

After several investigations, the U.S. International Trade Commission (ITC) ruled in June 1985 that the domestic footwear industry was being injured by imports of nonrubber footwear. The ITC recommended that the market share of imported footwear be reduced from 71 percent to 68 percent. Lower labor costs have helped foreign shoe manufacturers capture the major share of the U.S. market: the average hourly wage of a shoemaker is $6.71 in the United States, but in Brazil and Taiwan, both major shoe exporters, the averages are $0.85 and $0.91 per hour, respectively.[66] The import price index for footwear declined during the first two quarters of 1985 and then increased during the last half of the year. Prices for U.S. wetblue hides, the main source of shoeleather, began to rise at midyear, boosting the costs of world shoe production. However, the fluctuation in footwear prices resulted in only a 0.1-percent index increase in 1985.

Import prices for photographic apparatus and supplies, optical goods, and watches and clocks increased 3.9 percent. The surge in consumer spending has spurred demand for photographic equipment. The amateur photography market has shifted away from instant and 110 cartridge cameras toward 35 mm cameras, especially compact cameras priced under $100.[67] The 35 mm market is dominated by Japan. In the past 2 years, there has been a great deal of product innovation in this area. Also, increased competition among Japanese firms and their desire to increase U.S. market share caused prices to decline early in 1985. As the year wore on, however, the weakening of the dollar and the approaching Christmas shopping season caused prices to increase. The price for imported photographic supplies slid in 1985 as domestic and Japanese firms competed aggressively in the U.S. market for sensitized film, paper, and plates.

The import price index for collectors' pieces, including gold and silver coins, registered a 4.8-percent decrease in 1985. Prices took a 12.3-percent tumble in the first quarter as investors switched to U.S. dollar denominated investments such as bonds. Prices rebounded in the second quarter as a South African gold mine strike cut gold supplies. In late September, the U.S. Government announced that it was suspending the importation of the South African krugerrand in retaliation for the South African policy of apartheid. Though this should have affected demand for gold coins, prices fell in the fourth quarter, in part because domestic interest rates hit a 6-year low in November.[68]

[1] This category includes indexes in addition to those shown here. For all of the indexes available in each category, see *U.S. Import and Export Indexes*, USDL–86–38 (Bureau of Labor Statistics), January 30, 1986.

Crude materials. The crude materials import index, which represents 4.2 percent of all imports, declined 7.8 percent for the year because of oversupply of basic commodities. Global stocks of rubber, lumber, and metalliferous ores all exceeded demand.

Indonesia and Thailand continued expanding rubber output despite flat demand. The increasing switch from bias ply to radial tires has left excess rubber on world markets. Longer wearing radial tires require less frequent replacement, and hence, less rubber than their bias ply counterparts. The resulting oversupply of rubber has driven prices down. The imported crude rubber index declined 12.6 percent for the year despite some price firming in the fourth quarter. In response to declining prices, Malaysian growers are switching from rubber to palm planting in order to increase future earnings.

Despite mill closings, the U.S. lumber industry continued to suffer from overcapacity in 1985. This dampened corporate profits and import prices alike.[69] The index for wood imports fell 4.4 percent for the year, reflecting a number of developments here and abroad. In 1985, an estimated 1.736 million homes were started in the United States, slightly less than the 1984 total of 1.749 million units.[70] The decrease in housing starts may reflect the decision of potential homebuyers to wait for mortgage rates to bottom out.[71] In addition, the strong building boom of 1982–84 may have satisfied pent-up housing demand.

The pulp and waste paper index plunged nearly 20 percent for the year, as Brazil, Chile, Spain, Portugal, and South Africa stepped up pulp production in order to earn foreign currency.[72] Lack of profits in the U.S. lumber industry, coupled with the prospect of tax reform which would raise the cost of farming timberland, forced many U.S. firms to abandon all or part of their lumber business in 1985.

Imported metalliferous ore prices also declined, as domestic aluminum and stainless steel production decreased last year. In 1985, primary aluminum production in the United States was 14.6 percent below 1984's volume of 4.518 million short tons.[73] Meanwhile, U.S. stainless steel production for the year was 4 percent lower than 1984 levels.[74] These declines dampened demand for bauxite and alumina used in aluminum production, and for ores of tantalum, zinc, columbium, and other metals used in steel alloying. Imported metalliferous ore prices fell 5.8 percent as a result.

Intermediate manufactures. In October 1984, the Reagan administration negotiated voluntary export restraints with 15 nations supplying steel to the United States. The goal of these restraints was to limit foreign suppliers to 18.5 percent of the U.S. steel market. Through the first three quarters of 1985, imports from these countries were 14.4 percent below the previous year's 9-month mark.[75] But imports from other nations continued to rise. In fact, 18 nations without any known steelmaking facilities were listed as suppliers to the United States last year, including such small countries as Antigua, the Netherlands Antilles, New Caledonia, and the Bahamas. Some of these shipments were in the form of processed steel products, which had been finished at facilities in the exporting nations. In other cases, however, U.S. steelmakers charged that major producing countries had violated their quota agreements by shipping steel through neighboring nations in order to avoid exceeding their own quotas.[76] Altogether, foreign steel captured an estimated 25.2 percent of the U.S market last year, down slightly from 26.4 percent in 1984.[77]

These imports encountered falling prices in the United States, as a result of overcapacity and declining demand. By one estimate, annual Free World steel production capacity currently is 625 million metric tons, whereas Free World demand is only 440 million metric tons.[78] This excess supply comes at a time when American users are reducing demand for steel,[79] because of an increase in automobile imports and a continuation of the switch from steel to plastics and other metals in the manufacture of packaging and automotive products. Reduced consumption led to price cutting by suppliers. The import price index for iron and steel declined 4.4 percent over the course of the year.

The nonferrous metals fared little better last year. In late October, the International Tin Council announced it could no longer afford to purchase excess tin stocks from producers in order to shore up the metal's price on the London Metal Exchange.[80] This decision sent tremors through the Exchange; tin trading was suspended, and prices of nickel, zinc, and other metals fell as dealers sold contracts for those commodities quickly to raise funds to cover their potential tin losses. At the time of the trading suspension, metals dealers held contracts for more than 50,000 tons of tin at the Exchange's price of $12,100 per ton.[81] The extent of traders' losses will not be known until trading resumes. Off the London Metals Exchange, tin was selling for $2,000 below the Exchange price. If prices fall rapidly once trading is resumed, the world's major metals traders could be forced into bankruptcy. In the United States, prices for imported tin fell 19.6 percent in the fourth quarter of 1985, and 16.5 percent for the year as a whole.

Platinum and silver prices were depressed early in the year, as continued low rates of inflation in the United States reduced the appeal of the two metals as inflationary investment hedges. As interest rates declined, however, platinum and silver became more attractive for investors whose return on paper assets was falling. Also, demand from the U.S. auto industry, which uses platinum in emissions control devices, increased during the second quarter as Detroit reported its highest quarterly output for the year. Fears that supplies from the Republic of South Africa, the world's number one platinum producer, might be interrupted, drove up prices late in the year.[82] Altogether, the index finished the year down 9.7 percent.

Copper import prices rose slightly in 1985, as U.S. metals firms continued to reduce capacity and to rely heavily on imports. Third World nations such as Chile and Zambia have been exporting copper extensively in order to obtain foreign exchange to service foreign debt.[83] U.S. copper imports as a percentage of consumption reached an estimated 27 percent last year, after claiming 23 percent of the

U.S. market in 1984.[84]

Nickel import prices rose in the beginning of 1985, as output failed to keep pace with demand.[85] The United States imports most of the nickel that it uses in petroleum refining, and in chemical, electrical, construction, and aircraft industries. Although activity in these industries remained vigorous late in the year, uncertainty surrounding the fate of the London Metal Exchange and its dealers caused the metal's price to fall by yearend. Overall, the import index for nickel was down 5.5 percent for the year.

Fats and oils. The fats and oils import index plummeted 56 percent for the year, reflecting abundant stocks of Malaysian palm oil, Philippine coconut oil, Argentinian sunflower seed oil, and Brazilian cottonseed oil.[86] Malaysian palm oil production, for example, was 24 percent higher in October 1985 than in October 1984.[87]

Export price trends

Machinery and transport equipment. Price advances in exports of U.S.-made machinery and transport equipment moderated in 1985. After rising 3.3 percent in 1984, the export index for these products increased a mere 1.3 percent last year. The index encompasses more than a third of the all-export index.

Prices for exported general industrial machinery, metal working machinery, specialized machinery, power generating machinery, and autos all rose. On the other hand, prices of exported semiconductors and automated data processing equipment were lower. Telecommunications equipment export prices were virtually unchanged for the year.

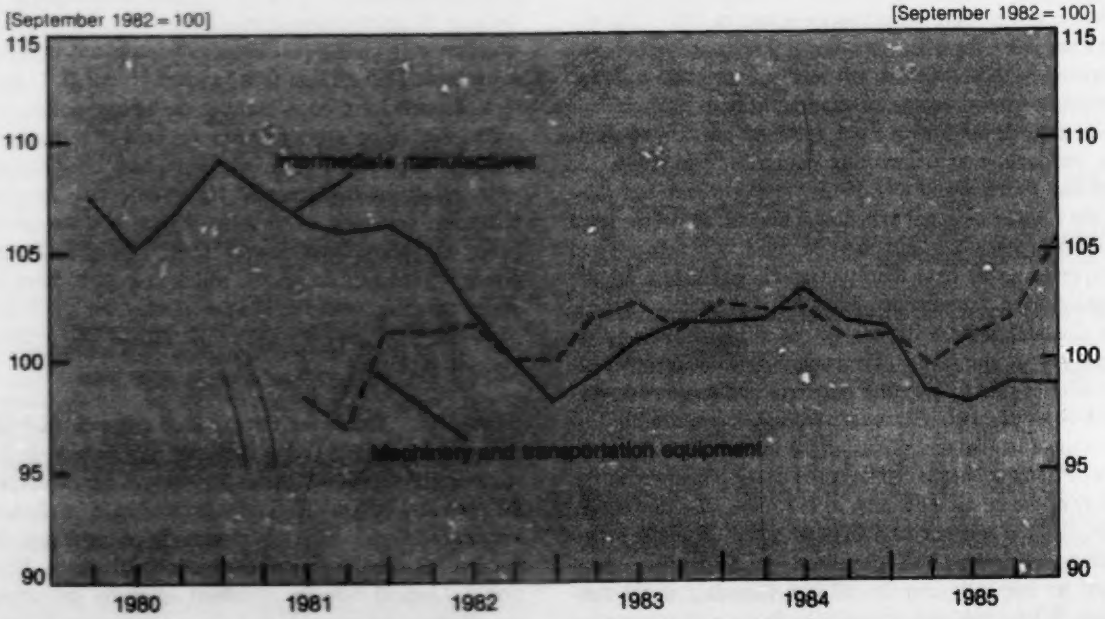
The dollar volume of machine tool exports in the first three quarters of 1985 was 12 percent higher than for the comparable period of the previous year.[88] Prices for these items advanced 4.3 percent for 1985 as a whole, continuing their strong upward trend.

The index for power generating machinery advanced a slight 0.1 percent, fueled by the 2.4-percent price rise for engine replacement parts.

The road vehicles and parts index advanced 2.4 percent for the year. This also was largely attributable to price increases for parts. In the fourth quarter, however, automobile export prices rose 2.1 percent, reflecting new model year price increases. For the year as a whole, automobile export prices advanced 4.2 percent, and parts prices increased 1.8 percent.

Automated data processing equipment, telecommunications equipment, and semiconductor export prices were constrained by several factors in 1985. First, the emergence of South Korea as a low-cost producer in these fields limited the pricing power of U.S. firms in global markets. Secondly, delivery delays and uncertainty concerning the new products developed by U.S. producers for the year caused many overseas buyers to adopt a "wait and see" attitude

Chart 6. U.S. import price indexes for selected commodity groups, quarterly data, 1980-85



toward new equipment purchases.[89] Lastly, rapid advances in technology have shortened product lifespans in these areas. Fiber optics, gallium arsenide integrated circuits, and small, personal-computer-compatible hard disk drives are steadily replacing existing product lines. This resulted in price cutting to move inventories before they become obsolete.

Food. For U.S. agricultural exporters, 1985 was a difficult year. Large crop yields caused an oversupply of grain on the market, and forced export prices down. This was reflected in the U.S. export price index for food, which declined 3.0 percent in 1985. This index comprises 12.8 percent of the all-export index. A 6.2-percent decline was recorded in the grain and grain preparations index, but the index for animal feeds was up 1.2 percent. Those two indexes account for 80 percent of the export food price index. Export prices for wheat, rice, barley, yellow corn, and yellow sorghum declined.

Record yields of corn, oats, sorghum, and rice were produced in the United States in 1985, the year of the second highest total crop production ever recorded. This occured even though 7 million fewer acres of land were in production than during the previous year.[90] Coupled with large existing inventories from 1984, this development meant supply exceeded demand.[91] In addition, two of the Nation's large customers, the Soviet Union and China, increased agricultural production last year. With the competition from agricultural exporting countries strong, the U.S. share of world agricultural exports is expected to show a decline again in 1985, following a drop to $31 billion in 1984.[92]

Wheat prices were significantly lower in 1985. The export price index for wheat declined 4.9 percent for the year, compared with a decrease of only 0.2 percent in 1984. Worldwide import demand in marketing year 1985–86 was expected to be the lowest since 1979–80 because of abundant yields in many importing countries.[93] In 1984–85, there had been a record worldwide yield of wheat. In 1985–86, the yield is expected to be lower but still above the level recorded in 1983–84. Although the 1985 U.S. wheat yield is expected to be near the 1984 level, production by the United States' four major competitors (Australia, Argentina, Canada, and the EC) is expected to be 10 million tons below year-earlier levels. The declining yields of competitors were caused by planting problems and a switch to different types of crops. However, excess accumulated inventory should negate the effects of the lower yields.[94]

Both Canada and the EC experienced problems with the quality of the wheat they grew in 1985. Because of weather problems, the amount of Canadian wheat in the top two grades was down. This prompted the Canadian Wheat Board to suspend sales to all but Canada's usual customers.[95] To combat their quality problem with wheat, the EC released bread wheats from their stockpiles.

Some of the EC's agricultural policies are undermining the United States' export trade. In 1985, the Community increased export subsidies on sales to countries targeted in the U.S. export enhancement program, especially those of North Africa.[96] The U.S. program, The Bonus Incentive Commodity Program (BICEP), which was announced May 15, 1985, is designed to allow government commodity stocks to be given as bonuses to importers of designated U.S. agricultural commodities over the next 3 years.[97]

The 1984–85 worldwide production of coarse grains was 810.24 million tons. Coarse grains include barley, sorghum, corn, rye, and oats, which are primarily used as animal feeds. For 1985–86, production is expected to reach 844 million tons.[98] The United States produces one-third of the world's coarse grains, and within that, one-half of all corn grown. The corn export index was down 7.6 percent in 1985. The U.S. supplies of coarse grains were very large because of good weather and increased planting; the Nation's total 1985 production is estimated to be 271 million tons.[99] The yield of the United States' major competitors is also expected to be large. Although production by Australia and Argentina may be down, Canada, Thailand, and South Africa expect a good output. In fact, corn yields from Canada's eastern provinces are expected to exceed all previous records.[100]

Demand for coarse grains is expected to decrease by 8 percent in 1985–86.[101] This is largely attributable to lower purchases by the Soviet Union, which both boosted coarse grain production in 1985 and had a decrease in livestock. Purchases by that nation may drop as much as 10 million tons.[102] The United States' second leading export market is Japan. Although U.S. sales to Japan decreased in 1984 because of competition from Chinese and Thai corn, this situation may change as Japanese imports are expected to increase to 21.5 million tons in 1985.[103] All U.S. agricultural exports have been hurt by the strong dollar, which makes the Nation's products more expensive in foreign currencies. Also, coarse grain sales have been affected by austerity programs implemented by some of the developing countries, declining EC imports of corn and increased exports of barley, and higher U.S. agricultural support prices.[104] The support prices, which keep U.S. farm prices higher than they would be in a free market, have encouraged many nations to develop their farm sectors and to increase agricultural output.

Chemicals. The index for exported chemicals decreased 1.1 percent in 1985, after declining 0.9 percent in 1984. Historically, the United States has enjoyed a trade surplus in the chemical industry due to its leadership in product innovation. Similarly, large investments in research and development have led to greater production efficiency. The Nation's chemical industry remained relatively unscathed by the effects of the strong U.S. dollar, with exports decreasing only 2.5 percent in 1985. However, the industry is facing stiffer competition worldwide. For example, many of the oil-producing nations have set up petrochemical operations. With abundant supplies of low-cost inputs, these producers are further contributing to world oversupply and lower prices.[105]

The problem of worldwide oversupply greatly affected the fertilizer industry in 1985. A 12- to 15-percent oversupply of phosphate chemicals and phosphate rock on world markets resulted in price cutting early in the year.[106] Producers claimed to be selling at or below production costs, and a number of high-cost U.S. manufacturers were forced out of business. Prices for fertilizer components also fell over the year. Anhydrous ammonia, a major input in fertilizer production, experienced a drastic reduction in export prices. The index in which this compound is included—inorganic elements, oxides, and salts—declined 13.7 percent in 1985. Toward the end of 1985, the oversupply of fertilizer began to diminish as stocks were depleted, and prices subsequently rose. In the last two quarters of the year, the export index for fertilizers rose 2.4 percent.

In 1985, the United States enjoyed an increase in exports of propylene, which is used chiefly for organic synthesis. In the past, U.S. exports of propylene have been limited to Canada and Mexico because overseas shipment of the substance requires the use of refrigerated gas carriers. In 1985, a fire in an ethylene/propylene plant in Italy significantly reduced supplies in southern Europe. This, along with the tremendous price differential between European and U.S. propylene gave U.S. producers an incentive to expand into European markets. (European prices are estimated to be $410–$415 per metric ton while U.S. prices are running about $345–$350.[107]) A Far East market also appears to be opening up. The increased demand for propylene caused prices in the export index for hydrocarbons to rise 1.8 percent for the year. □

Inflation remained mild again during 1985

Consumer prices rose by less than 4 percent, about the same as during 1982–84; the rate of increase for producer prices of finished goods was less than 2 percent, as inflation continued to be moderate for the fourth consecutive year

CRAIG HOWELL AND ANDREW CLEM

The rate of inflation in the American economy continued to be moderate for the fourth consecutive year. For the 12 months ended in December 1985, the Consumer Price Index for All Urban Consumers (CPI–U) advanced 3.8 percent, about the same as during 1982–84. Once again, the rate of increase in the Producer Price Index (PPI) for Finished Goods was even lower than the CPI's, moving up only 1.8 percent over the same 12 months. (See table 1.)

As in 1984, small increases in prices for food, energy, and other consumer goods kept the all items CPI advance moderate. Although 1985 energy prices rose more than in 1984, the increase was still under 2 percent. The indexes both for food and for commodities other than food and energy slowed noticeably, to increases of less than 3 percent. However, several categories of consumer services, such as shelter, medical care, and education, continued to register above-average increases. The CPI for services other than energy rose 5.7 percent, approximately the same as in 1984.

In 1985, the PPI for Finished Goods rose less than 2 percent for the third consecutive year, having increased 1.7 percent in 1984 and 0.6 percent in 1983. Producer prices for intermediate and crude goods actually decreased in 1985. After moving up less than 2 percent in both 1983 and 1984, the intermediate materials, supplies, and components index fell 0.3 percent, the first calendar year drop in this series since 1962. The index for crude materials for further processing fell rapidly through the first 9 months of 1985, before recovering somewhat in the fourth quarter to finish the year 5.5 percent below its December 1984 level. This was not only more than the 1.6-percent decrease recorded between December 1983 and December 1984, it was also the largest annual decline in crude material prices in a third of a century.

Much of the moderation in 1985 price movements was related to competition from imported goods. The price index for All Imports published by the Bureau of Labor Statistics fell 1.1 percent in 1985, following a 1.6-percent decline the year before. (See the article on import and export prices in this issue of the *Review*.) Whereas declines in 1984 were widespread among end-use categories of imported goods, in 1985 the downward impulse was concentrated in the categories of petroleum—down 4.9 percent—and other raw materials—down 7.1 percent. In contrast, prices for imported automobiles and parts jumped 5.9 percent over the year, partly reflecting the decline of the dollar vis-a-vis the

Craig Howell and Andrew Clem are economists in the Office of Prices and Living Conditions, Bureau of Labor Statistics. They were assisted by William Thomas and Roger Burns, economists in the same office.

Japanese yen, and the continued informal Japanese export restrictions.

The enormous volume of imported goods absorbed a substantial portion of growth in aggregate demand, so that most domestic industries continued to operate well below their potential levels of output. Total industry capacity utilization in the United States hovered around 80 percent throughout 1985; historically, this rate has approached or exceeded 90 percent once the economy is 3 years into a business cycle expansion. (The current expansion began at the end of 1982.)

Having slowed sharply in mid-1984, the general expansion of the American economy regained some vigor after mid-1985, aided by less restrictive monetary policies and a considerable drop in interest rates. Consumer spending continued to climb, undeterred by mounting consumer debts and low rates of personal saving. However, after several years of unusually strong growth, investment spending increased more slowly. Uncertainties generated by possible changes in tax laws affecting capital expenditures may have contributed to business caution on long-range commitments. The residential housing market was no stronger than it had been in 1983 and 1984, in spite of a substantial drop in interest rates over the 1983–85 span. Tighter credit eligibility restrictions by mortgage lenders effectively limited housing demand by disqualifying many potential home buyers without sufficient resources for a substantial downpayment. At year's end, there were few labor or material shortages or capacity constraints threatening to reignite inflation.

The sustained record of low inflation from 1982 to 1985 in the midst of strong aggregate economic growth has not been matched in the United States for nearly two decades. Accordingly, this article will take a different slant than those of previous years. Before focusing on the causes of 1985 price changes for particular goods and services, we will employ a long-term perspective to identify major recent trends.

Major trends

Although energy prices were a major source of inflationary pressures from 1979 to 1981, they have been the principal moderating influence during the last 4 years. In the earlier years, retailer profit margins were squeezed as consumer resistance prevented the full passthrough of increased producer prices of gasoline and fuel oil. In general, consumer prices have not reflected the volatility seen in the producer market in the subsequent period. Retail price declines have been moderated by increased State, local, and Federal excise taxes over the 1982–85 period, while dealers have been reluctant to reduce their recovered margins over the last few years. Declines in producer prices for refined products have reflected fundamental changes in the structure of the world petroleum market. During the early 1980's, consumers and businesses throughout the industrial world dramatically curtailed energy consumption in response to skyrocketing prices. At the same time, increased production of crude oil by such non-OPEC nations as Britain and Mexico

Table 1. Annual percentage changes for major categories of the Consumer Price Index and Producer Price Index, 1978–85[1]

Consumer Price Index	1978	1979	1980	1981	1982	1983	1984	1985[2]

[2] Producer Price Index data for December 1985 are subject to revision.

introduced a new element of competition that eventually led to sharply falling prices.

Food prices have behaved more moderately than the All Items CPI–U in every year since 1979, having a favorable cumulative effect on the overall inflation rate. Consumer prices for food rose 2.7 percent in 1985, following 4 years of similarly moderate advances. It is interesting to note that producer prices for consumer foods (up only 0.3 percent in 1985) have risen at a slower rate than prices at the retail level in each year since 1978. The persistent gap in trends between the CPI and the PPI for foods would seem to imply a rise in the share of the food dollar going for marketing, packaging, and distribution. A further salient aspect is that prices received by farmers have *declined* in most recent years. The PPI for crude foodstuffs and feedstuffs was 5.3 percent lower at the end of 1985 than it had been 6 years earlier. Reduced foreign demand for foodstuffs, partly reflecting greater production abroad, as well as the unusual strength of the U.S. dollar during most of the 1980's, contributed to already substantial domestic stocks and kept food prices in check.

While prices have slowed substantially in most sectors of the economy in recent years, charges for consumer services have not slowed nearly so much as prices for consumer commodities have. Among the various explanations offered for this trend, an important one is that prices for goods have responded to competitive pressures from the foreign sector. Between late 1980 and early 1985, the exchange value of the U.S. dollar staged a massive advance because of high real interest rates and a surge (at least since the end of the 1981–82 recession) in investor confidence. The stronger dollar made it cheaper for Americans to buy foreign goods, while prices of U.S. exports rose because of the relative fall of other nations' currencies. As a result, domestic manufacturers were often forced to hold their prices to relatively low levels to avoid losing too much of their market share to imports. Although the dollar began to decline in the spring of 1985, the price effects will take some time to materialize. Consequently, there was little perceptible influence on prices during the latter part of the year.

A clear trend observed in table 1 is the steady deceleration in consumer inflation rates for commodities other than food and energy since the peak year in 1980. Furthermore, it is apparent that inflation has virtually ceased or even reversed among intermediate and crude materials in recent years. As already noted, the strength of the U.S. dollar has made an important direct and indirect contribution to these developments. Another important factor has been the modest increase in labor compensation. The Employment Cost Index for compensation of private industry workers in goods-producing industries has slowed in each successive year since 1981, from an annual increase of 10.0 percent in 1981 to only 3.2 percent in 1985.

Although price increases for most consumer services have moderated considerably since 1981, they have generally continued to rise more rapidly than commodity prices. A variety of institutional factors have contributed to this difference. In general, service industries do not have to contend with the same type of foreign competition faced by goods-producing industries. Although price advances for tuition and other school fees have slowed somewhat in the last few years, they have shown more resistance to moderation than other items—rising 8.4 percent in 1985.

Having reviewed the general course of inflation in recent years, we will now take a closer look at producer price changes during 1985.

Finished goods

Prices received by producers of finished goods rose 1.8 percent, about the same as in 1984; however, price movements of the individual components were somewhat different. Consumer food prices rose much less than a year earlier; energy prices showed no net change after falling during 1984; and the index for finished goods other than foods and energy moved up somewhat more than in the previous year.[1]

The index for finished consumer foods inched up 0.3 percent in 1985, following a 3.5-percent rise in the preceding year. Prices for pork, beef, and veal, processed poultry, and fish fell significantly for much of the year, largely because of plentiful supplies, but turned up by year-end; only beef and veal ended the year in the minus column. Consumer demand continued to drift away from red meats toward poultry and fish. Egg prices rose nearly 7 percent in 1985, after falling the previous year when egg farmers over-expanded flocks. In contrast, shortening and cooking oils were 15 percent lower than a year earlier, as both animal- and vegetable-based products showed declines. Prices also dropped over the year for dairy products and soft drinks.

Among finished energy goods, the index for natural gas moved down 6.2 percent, after rising 1.0 percent in 1984. This decline reflected lower prices for interstate gas following the lifting of controls in January 1985 on most U.S. wellhead natural gas under the 1978 Natural Gas Policy Act. However, indexes for gasoline and home heating oil turned up after falling a year earlier. Gasoline prices were poised for sharp declines in 1985, amid strong expectations of falling crude oil prices because of disarray within OPEC and general worldwide overproduction. While gasoline prices did post a net decline for the second half of the year, this was insufficient to offset the unusually strong advances that occurred in the spring when the glut of gasoline on the market eased. After drastic declines in the first half, fuel oil prices rose sharply in the second half when inventories of heating oil were unusually low. Hoping that crude oil prices would fall, refiners sometimes preferred to buy fuel oil from other refiners instead of buying crude oil on the spot market. The resulting surge in purchases of heating oil in some areas led to higher prices.

The index for consumer goods other than foods and energy advanced 2.7 percent in 1985, after rising 2.2 percent a year earlier. Increases were widespread and generally moderate. However, passenger cars rose 4.5 percent and light motor trucks increased 8.0 percent, the largest annual advances in 3 years. Demand for cars and trucks boomed over the year, peaking at periods when low-interest financing and other incentives were in effect, then slumping when they were discontinued. Light trucks became increasingly popular as the second family car; 1985 sales of light trucks exceeded the previous record of 4.3 million sold in 1978. Domestic manufacturers sold about 8.2 million passenger cars in 1985, compared with 7.9 million in 1984.

From December 1984 to December 1985, the capital equipment index advanced 2.7 percent. Inflation for most domestically produced capital goods was restrained by continued fierce competition from imported machinery. Although capital spending rose in 1985, the rise was smaller than in other recent years. Unlike a year before when there was widespread optimism, several developments caused business to become more cautious about investment spending in 1985. For example, uncertainty over the possible cancellation of the investment tax credit increased, and speculation persisted on whether there would be a change in the period over which companies could recover their investment in machinery through depreciation allowances.

Intermediate goods

The Producer Price Index for Intermediate Goods edged down 0.3 percent from December 1984 to December 1985, following a 1.3-percent rise during 1984. Moderate declines were widespread among products within this category, while annual increases of more than 3 percent were rare.

Despite the improvement in the economy after midyear, metal markets were generally sluggish in 1985. For example, demand for domestic steel was limited. Restrictions on steel imports reduced the market share won by foreign steel producers only marginally. Some producers who were in financial straits lowered their prices to maintain or increase their market share and to generate needed cash. The continuing trend towards substitution of plastics and aluminum for steel in many major products also kept steel manufacturers from boosting output.

Prices for many nonferrous metals were considerably lower at the end of 1985 than they had been a year earlier. Tin, lead, and zinc all fell more than 20 percent. After fluctuating indecisively during most of 1985, tin prices plummeted nearly 30 percent in November and December. The financial collapse of the International Tin Council, which had been maintaining a massive buffer stock in order to support tin prices, precipitated the abrupt price drop. Lead and zinc prices fell because of a surplus in world markets that persisted despite production cutbacks in North America. (Because these two "sister metals" are generally mined together, their respective production levels are interrelated.) Aluminum prices continued to fall moderately in 1985, as demand did not improve enough to pare worldwide inventory levels sufficiently. In contrast, copper prices rose 7.5 percent, the first yearly increase since 1979. Recent increases in copper prices have been attributed in part to the falling value of the U.S. dollar. Gold prices were much less volatile than in recent times, finishing the year 2.9 percent lower than in December 1984. Silver was down more sharply (14.6 percent), partly as a result of large sales of private holdings.

Prices were weak throughout the textile industry during 1985. In recent years (particularly since 1983), competition from foreign producers has intensified in textile material markets, above and beyond the longstanding foreign penetration of apparel markets. For example, domestic production of manmade fabrics was down nearly 10 percent during the first three quarters of 1985, compared with the same period in 1984. Decreased domestic production of these textile fabrics had a direct impact on American producers of synthetic fibers, the index for which fell 4.8 percent over the year. This was the fourth consecutive annual decrease and the largest such drop on record.

The domestic electronics industry suffered an unusually sharp slump during the year because of a slowdown in personal computer sales and intensified competition from foreign (mainly Japanese) component suppliers. The PPI for electronic components and accessories edged up only 0.7 percent in 1985, the smallest rise in 10 years. Sharp price declines were particularly evident in the semiconductor industry, where prices for some advanced integrated circuits plunged more than 40 percent.

Construction material prices edged up 1.0 percent over the year. There was considerable variation in price behavior among the various kinds of construction materials. Several kinds of nonmetallic mineral products climbed moderately. Gypsum product prices turned up 8 percent, recovering from the drop that had occurred in 1984's second half. In contrast, prices for plastic plumbing products dropped nearly 12 percent, and lumber and plywood prices declined for the second consecutive year. While the residential housing construction market remained fairly good in 1985, it did not expand in response to the general drop in interest rates; this had a restraining impact on prices of lumber and other wood products heavily used in building new homes. The commercial construction market, however, had a very strong year, helping to boost prices for those materials used in erecting office buildings.

The index for intermediate energy goods moved down 0.8 percent in 1985. Residual fuel prices fell 15.6 percent, principally because of reduced world demand following the settlement of the British coal strike. Prices for jet fuels and coke also decreased. These declines were nearly balanced by increases for electric power, gasoline, and diesel fuel. The 4.7-percent fall in the index for intermediate foods and feeds was led by substantial decreases for crude vegetable oils and animal fats and oils. Price movements for other products in this category were moderate.

Among other kinds of intermediate goods, prices for woodpulp fell more than 15 percent, as a shift from seasonal to year-round production resulted in a sizable rise in supplies. Paperboard prices declined nearly 10 percent, reflecting an overexpansion of capacity in this country and Canada. Prices for paper and paper boxes and containers moved down modestly. Prices and production levels in the pulp and paper products industry had risen steadily during 1983 and most of 1984. Moderate decreases were registered for a number of other products, such as mixed fertilizers, plastic resins and materials, synthetic rubber, and medicinal and botanical chemicals.

Crude goods

The Producer Price Index for Crude Materials for Further Processing dropped 5.5 percent, following a 1.6-percent decrease in 1984 and a 4.7-percent advance in 1983. The indexes for foodstuffs and other nonenergy materials both fell more in 1985 than in the preceding year, following increases in 1983. The crude energy price decline, which had slowed in 1984, nearly matched the 1983 rate of decrease.

After moving down 1.2 percent a year earlier, the crude foodstuffs and feedstuffs index fell 6.4 percent from December 1984 to December 1985. The index declined through the first 9 months of the year before recovering somewhat in the fourth quarter. Falling prices prevailed while livestock farmers liquidated portions of their herds in order to meet the high debt service costs incurred in connection with previous loans for expanded production. Prices then turned up at the close of 1985 as this liquidation of stocks left livestock inventories low. The decline for grain and feedstuff prices reflected continued bountiful harvests both here and in many other countries. However, inclement weather in some areas and higher export demand generally pulled fourth-quarter prices up.

The crude energy materials index moved down 4.3 percent, considerably more than the 1.3-percent decline for the previous year. The bigger decrease was principally because of a 6.2-percent drop in the natural gas index, the largest yearly decline on record. Crude petroleum prices fell for the fourth consecutive year, moving down 4.0 percent. Most of the decline occurred in the first quarter as a response to the October 1984 cut in international light crude oil prices by North Sea producers; prices were relatively stable through the rest of the year. The coal index dropped 1.4 percent, the first annual decrease since 1975. Contract coal prices, which were in many cases tied to declining indexes for fuel oil and natural gas, turned down in 1985.

The index for crude nonfood materials other than energy dropped 4.5 percent, following a 3.3-percent decline in 1984. Lower prices for ferrous scrap and iron ore were prompted by slack demand from domestic steel manufacturers. Prices for aluminum base scrap fell because of an oversupply of primary aluminum, and brass scrap dropped as it followed the downward movement of primary zinc. Leaf tobacco was down a record 11.6 percent, reflecting reduced effective price supports and large supplies. Raw cotton prices were lower as a result of burdensome stocks and weak demand from domestic fabric manufacturers confronted with intense foreign competition. The 38.5-percent fall in wastepaper prices was chiefly a reaction to the sharp drop in prices for woodpulp, which competes with wastepaper as a basic material in the manufacture of certain paper products. In contrast, cattle hide prices increased in response to good demand from foreign apparel manufacturers, coupled with low supplies in the wake of a partial liquidation of cattle herds. □

——FOOTNOTE——

[1] Effective with data for July 1985, the 1-month lag in indexes for major refined petroleum products was eliminated. At the same time, the sample of refined petroleum products was reweighted.

Wage restraints continue in 1985 major contracts

Wage adjustments were low for the fourth year in a row, reflecting pressures to restrain labor costs and save jobs; many contracts negotiated in 1985 featured 'back-loading,' lump-sum payments, and two-tiered systems

JOAN BORUM AND JAMES CONLEY

For the fourth consecutive year, major collective bargaining agreements in 1985 provided record low or near-record low wage adjustments, as measured by the Bureau of Labor Statistics' 18-year-old series on private industry agreements covering 1,000 workers or more.[1] Pressures to restrain labor costs dominated major negotiations during the year, and are evident in the size of settlements. First-year wage adjustments (the net effect of decisions to increase, decrease, or not change wages)[2] averaged 2.3 percent, the lowest since the series began in 1968. Wage adjustments over the life of the contracts[3] averaged 2.7 percent annually, next to the lowest. Wage adjustments actually put into effect during 1985 averaged 3.3 percent, also a historic low.

For almost all the settlements in 1985, the year marked at least the second or third round of bargaining since the average size of wage adjustments in settlements started to fall during 1981. (See chart 1.) The last time the parties to 1985 settlements bargained, usually in 1982 or 1983, they agreed to average specified wage adjustments of 3.9 percent in the first contract year and 3.7 percent annually over the contract life.

When cost-of-living adjustments (COLA) are added to the specified adjustments, predecessor contracts to the 1985 settlements upped wages an average of 4.4 percent annually over their contract life. Total wage adjustments implemented under expired contracts have declined steadily since 1983 because of moderation in the size of specified wage changes and because of lower COLA's resulting from the deceleration in the rate of price increases. As shown in the following tabulation, the predecessor contracts with COLA clauses provided smaller wage adjustments over their life than those without.

	With COLA	*Without COLA*
Total adjustment	4.2	4.7
Specified	3.0	4.7
COLA	1.3	—

Prior to 1983, expiring contracts with cost-of-living adjustment clauses provided smaller specified wage adjustments than those without, but COLA's more than made up the difference. The moderate increases in the Consumer Price Index (CPI) during the life of contracts that expired starting in 1983 kept down the size of COLA's, so that they were no longer large enough to compensate for the smaller specified adjustment in contracts with COLA's, compared to those without.

Cost-curbing efforts

In 1985, bargainers did not face inflation-related problems. The 3.8-percent increase in the Consumer Price Index for Urban Wage Earners and the 6.8-percent unemployment rate reached in December 1985 reflected improved economic conditions. However, bargainers did encounter many of the industry-specific problems faced by negotiators earlier in the decade. Increased competition from abroad and from domestic nonunion companies continued to erode

markets for many unionized firms, and the ensuing declines in job opportunities were a major concern of union leaders. Efforts to contain labor costs and make firms more competitive, and to save jobs figured prominently in negotiations. The results of some of these efforts show up in contracts that are "back-loaded," call for lump-sum payments rather than wage increases, and adopt "two-tiered" compensation systems. Other contracts simply limit the size of wage adjustments.

Back-loaded contracts. Contracts which call for lower specified wage adjustments in the first year than in subsequent years (back-loaded contracts) covered about 38 percent of the 2.2 million workers under 1985 settlements. Prior to 1983, almost all workers under multiyear settlements had their largest increases in the first year.

Back-loaded settlements provided wage adjustments averaging 0.6 percent in the first year and 2.6 percent annually over the contract life. Of the 830,000 workers covered by back-loaded contracts, 474,000 received no wage increase in the first contract year, 315,000 received smaller increases in the first than following years, and the remainder sustained initial wage cuts but no additional decreases over the life of their multiyear agreements. Although found in a variety of industries, back-loaded contracts were concentrated in apparel manufacturing, electrical machinery manufacturing, and construction.

About 36 percent of the workers under 1985 contracts were covered by "front-loaded" settlements (larger wage adjustments in the first contract year than in subsequent years), with adjustments averaging 4.2 percent in the first year and 3.3 percent over the life of the contract. The remaining 26 percent of the workers were covered by either 1-year agreements or multiyear contracts which provided equal wage adjustments each year.

Lump-sum payments. Almost one-third of the 2.2 million workers under 1985 settlements will receive lump-sum payments instead of the traditional increases in wage rates. (Lump sums are excluded from wage and compensation measures in this series.) Lump-sum payments limit labor costs because they are excluded when calculating the level of certain benefits, such as pensions, and do not raise the wage rate base from which future contracts must be negotiated.

On average, settlements with lump-sum payments gave smaller wage adjustments than those without. Adjustments averaged 1.2 percent in the first year and 1.8 percent annually over the contract life for settlements with lump sums; corresponding averages for settlements without lump sums were 2.8 and 3.2 percent. The majority of workers receiving lump-sum payments were in the apparel, electrical machinery manufacturing, and transportation industries, and more than half (363,000) of them were covered by back-loaded contracts.

Two-tiered structures. In another approach to long-term cost savings, 1985 settlements covering about 700,000 current employees provided for "two-tiered" wage systems. While not altering wages or benefits for workers already employed, two-tiered systems lower starting rates and progression rates for new hires. These dual wage structures might be temporary or permanent. Under the temporary systems, new employees start at a lower rate than incumbents, but the wage rates for new and current employees eventually merge. Under the permanent system, new employees never reach the pay levels of incumbent employees. In some cases, no cost savings may be realized from the two-tier system because no new workers may be hired during the life of the contract.

COLA clauses

Cost-of-living adjustment clauses were dropped in settlements covering 471,000 workers, or about 40 percent of those settling in 1985 who had such coverage in their previous agreements. Contracts covering about 173,000 workers in the trucking industry and 101,000 in apparel manufacturing were among those dropping COLA coverage.

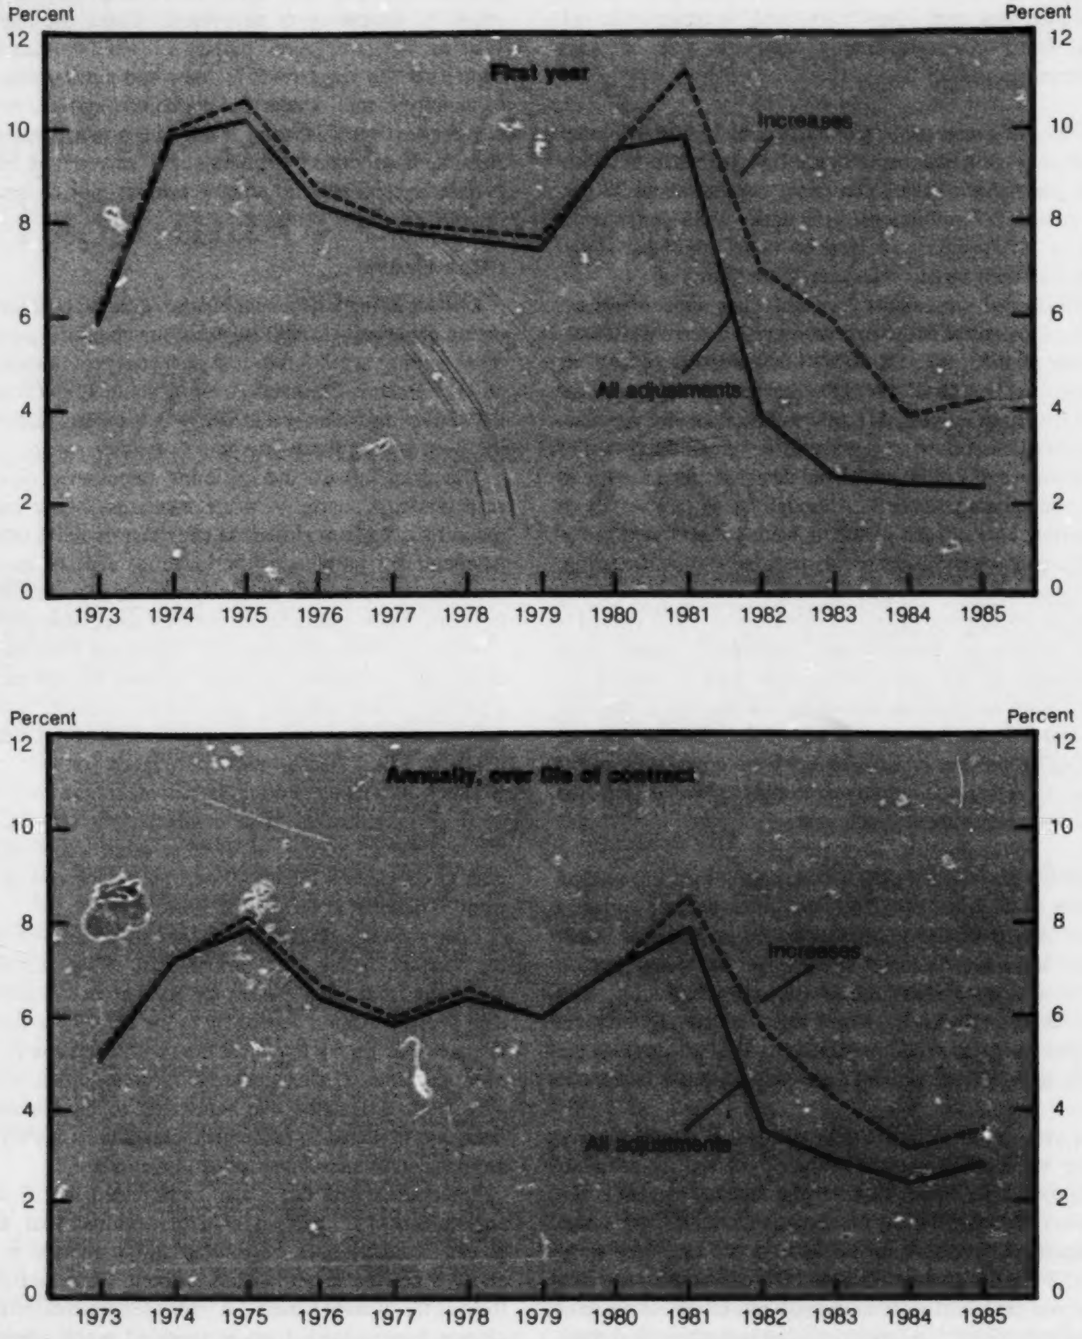
The drop reflects the declining importance of COLA's as a potential source of wage increases. Many contracts retaining COLA's modified the provision to delay or reduce payments by introducing or lowering caps or maximum amounts, or by diverting payments to cover increased benefit costs. Some contracts temporarily suspended payments.

Wage increases from COLA's during the preceding contracts were comparatively small because the CPI increased 4 percent or less annually. This led to increasing interest in negotiating specified wage changes instead of COLA clauses. In 1985, COLA clauses were introduced for only 41,000 workers. As a result of these developments and employment declines in industries with contracts that retained COLA clauses, the proportion of workers under major contracts with COLA clauses fell to 49 percent by the end of 1985, from 57 percent at the end of 1984.

Cost-of-living adjustment clauses covered 33 percent of the workers under 1985 settlements. Wage adjustments stemming from COLA clauses are not included in settlement data because COLA's depend on future changes in the CPI—changes that are not known at the time of settlement. However, guaranteed COLA amounts (those specified when the agreement is reached and scheduled to be implemented later) are included in settlement calculations because they are not tied to subsequent price movements.

Settlements with COLA clauses provided specified wage adjustments of 1.7 percent in the first contract year, and 2.5 percent annually over the contract life, compared with 2.7 and 2.8 percent in settlements without such clauses. This follows the historic pattern, in which settlements with COLA clauses have provided lower specified wage adjustments than those without, because the COLA provisions are expected to yield additional increases. (See chart 2.)

Chart 1. Average wage adjustments in private-sector settlements covering 1,000 workers or more, 1973-85



NOTE: All adjustments include increases, decreases, and no change.

Distribution of wage adjustments

Of the almost 2.2 million workers under 1985 settlements, about 1.4 million had first-year wage increases averaging 4.2 percent, 0.7 million had no wage change, and the balance had decreases averaging 8.8 percent. (See table 1.) Subsequent wage increases for almost half a million of the workers with no change in the first year will give them a net gain over the contract term. Thus, by the end of their contract, 85 percent of the workers will have received a specified wage increase averaging 3.5 percent annually. None of those with wage decreases in the first contract year will recoup the lost wages in subsequent contract years and, thus, will have decreases averaging 6.6 percent per year over the life of the contracts. (See table 2.)

Contracts with net wage increases were negotiated in a variety of industries including trucking, public utilities, apparel manufacturing, airlines, service, and retail trade. Wage freezes occurred primarily in the construction industry but appeared in other industries as well, including food stores, transportation equipment, and electrical products. About one-third of the workers who sustained wage decreases were in construction; the remainder were in a variety of industries.

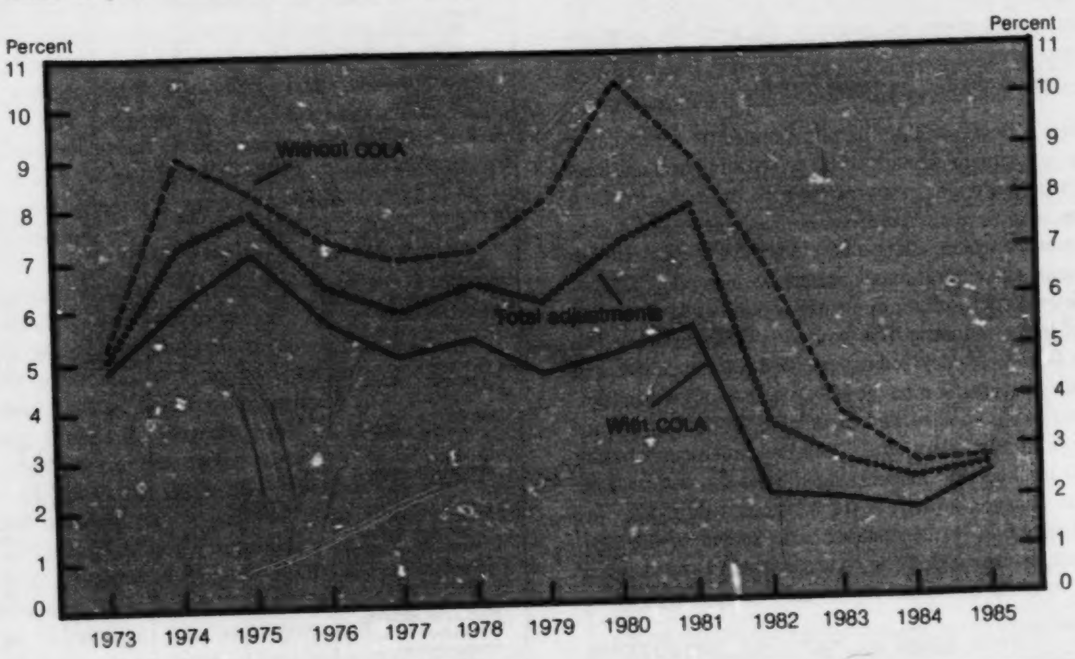
Compensation adjustments

The Bureau measures compensation (wages and employee benefits costs) changes in settlements covering at least 5,000 workers. These contracts cover about two-thirds of all workers under major settlements in 1985. Compensation adjustments under these settlements averaged 2.6 percent in the first contract year and 2.7 percent annually over the life of the contract. (See table 3.) Compensation increases were received by 9 of 10 workers under these settlements, and averaged 3.2 percent in both the first year and annually over the life of the contract. The remainder of these workers received either no change or a decrease in compensation during both the first year and over the life of the contract.

Major negotiations, by industry

Although settlements were concluded in a variety of industries in the first quarter, bargaining activity was light until spring, when the pace quickened. In some industries, talks continued from the second quarter into the third. For example, 91 percent of the construction workers under 1985 settlements had their contracts negotiated during the second and third quarters; negotiations in apparel primarily spanned May through September; and contract talks in wholesale and retail trade were also concentrated in this period. The following discussion summarizes these and other major negotiations: trucking and rubber industries in the second quarter, electrical products manufacturing in the third, and automo-

Chart 2. Average annual wage adjustments over the life of contracts with and without COLA in private-sector settlements covering 1,000 workers or more, 1973-85



bile manufacturing and railroads in the fourth.[4]

Construction. As in recent years, high unemployment and nonunion competition in construction have pressured bargainers to restrain wage demands and reduce employer costs to make union firms more competitive with their nonunion rivals. Although some contracts changed work rules, efforts to control costs concentrated on moderating wage rates: lower wage rates for new hires; lower rates for new projects than for work already in progress; and delaying wage increases to the second or third year of the contract. Thirty-one percent of the construction workers covered by 1985 agreements will have wage cuts or freezes over the life of their agreements.

These efforts to contain or reduce construction labor costs dampened the overall size of wage adjustments for all industries. Construction settlements, which covered 330,000 workers, provided average wage adjustments of 1.5 percent in the first year and 2.1 percent annually over the life of the agreements, compared with corresponding averages of 2.5 percent and 2.9 percent in other industries.

Wholesale and retail trade. With negotiations concentrated in the second and third quarters, settlements covering 234,000 workers in wholesale and retail trade were concluded in 1985. These contracts provided average adjustments of 2.8 percent the first year and 2.6 percent annually over the life of the agreements. Almost one-third of the workers under these contracts will receive lump-sum payments. Efforts to restrain labor costs and improve the competitive position of the firms have also led to the expansion of the already widespread use of part-time employees. This practice lowers costs, by reducing the need for overtime work and because part-timers may be paid less than full-timers and be eligible for fewer benefits.

Trucking. Beset with problems generated by deregulation and the recession in the early 1980's, Trucking Management Inc. (TMI), the major employer negotiator in the trucking industry, sustained a sharp drop in the number of member companies for which it bargains. Since the 1982 negotiation of the prior agreement, many companies merged, failed, or laid off workers resulting in a smaller number of firms and workers in the industry. The expired contract between TMI and the Teamsters provided no specified wage increase, and only one COLA increase on the effective date of the contract. All other COLA monies had been diverted to pay for increases in the cost of benefits. The May settlement covering 150,000 truckers and helpers, substituted the COLA clause based on changes in the CPI for a "guaranteed COLA" (an amount specified in the contract independent of the CPI). The contract also called for changes in work rules, in an attempt to make unionized firms more competitive.

Rubber. Closely linked to automobile manufacturing, which is still struggling with foreign competition, the rubber tire manufacturers had revitalized many of their plants since the prior round of talks. Negotiations were held under a backdrop of higher capacity utilization and fewer layoffs than in the early 1980's.

The 3-year agreement between the United Rubber Workers and B. F. Goodrich set the pattern for settlements with the three other major rubber manufacturers: Goodyear, Firestone Tire and Rubber Co., and Uniroyal. These contracts, covering 36,000 workers, raised wages 43 cents an hour over 3 years and maintained the quarterly cost-of-living clause providing a penny for every 0.26-point rise in the CPI-W.

Apparel. Over the past several years, the apparel industry has been plagued with high unemployment as the industry faces stiff competition from foreign imports. Contracts covering 285,000 workers represented by the International

Table 1. Wage adjustments for settlements, covering 1,000 workers or more in private industry, 1985

Measure	First year		Over life of contract	
	Average adjustment (percent)	Workers (thousands)	Average annual adjustment (percent)	Workers (thousands)

1985	63	33	3	85	12	3

Ladies' Garment Workers Union (ILGWU) and the Amalgamated Clothing and Textile Workers Union (ACTWU) were reached between May and October and featured some cost-saving features.

The agreements covering 125,000 workers negotiated by the ILGWU and various employer groups were back-loaded. Wages were frozen the first year. However, increases of 6 percent and 5 percent, respectively, are scheduled for the second and third years. The COLA clause, which had not generated any increases under the last two contracts, was unchanged; it provides for a 2-percent wage increase if the CPI–W rises 8.5 percent in an 18-month period. The contract also improved some health and welfare benefits.

The September agreement between the Cotton Garment Manufacturers and the National Trouser Association covering 101,000 workers represented by the ACTWU dropped their COLA clause which had not yielded any payment since 1981. The accord also provided a $500 lump-sum payment upon settlement and lump-sum payments of 6.5 percent of gross pay in 1986 and in 1987. A general 25-cent wage increase is scheduled for September 1987. Benefit increases include an 11th paid holiday—Martin Luther King's birthday—and increases in pension, sickness and accident, and death benefits.

Electrical products. Declining employment in the industry raised concern over job preservation in the contract talks in the electrical products manufacturing industry. The resulting settlements, covering 106,000 General Electric and Westinghouse workers negotiated by the Coordinated Bargaining Committee (a coalition of 13 unions) introduced lump-sum payments and a temporary two-tiered wage structure. As usual, the settlement with General Electric (for 80,000 workers) set the pattern for the Westinghouse accord. It provided for a lump-sum payment in the first year equal to 3 percent of the pay rate times 2,080 hours, and general wage increases of 3 percent in the second and third years. In addition, new employees will have to wait 8 months longer to reach the maximum pay rates for their job. The cost-of-living clause was continued providing 1 cent for each 0.175-percent change in the CPI–W, increasing to 1 cent for each 0.15-percent change in the third year.

Automobile manufacturing. In late October, an agreement covering 70,000 workers was reached between the Auto Workers and Chrysler Corp. providing parity with wage and benefit provisions in the General Motors Corp. and Ford Motor Co. contracts. The financial position of Chrysler had improved substantially since the United Auto Workers cost-curbing contracts negotiated in 1979, 1980, and 1981. The December 1982 contract had reduced the disparity between Chrysler's wages and benefits and those at Ford and General Motors, but differences remained. The 1985 Chrysler settlement eliminated these differences; it provided for a 2.25-percent wage increase in the first year; an October 1986 lump-sum payment equal to 2.25 percent of each employee's earnings during the preceding 12 months; and a 3-percent pay increase in October 1987. The cost-of-living clause was modified to match that covering GM and Ford workers—a 1-cent wage change for each 0.26-point movement in CPI–W quarterly, subject to a 1- to 2-cent diversion from each adjustment to help offset increased benefit costs.

Railroads. After negotiating for 2½ years, the United Transportation Union and the National Railway Labor Conference reached a settlement in December covering 82,000 operating engineers. The agreement followed the recommendations of a presidentially appointed emergency board. It provided that the 6,000 firemen and 2,000 hostlers (rail-yard train operators) would be phased out through attrition. Other terms were a six-stage wage increase totaling about 10.5 percent over the term of the agreement (an average of about $1.37 an hour); a $565 lump-sum payment in lieu of making the initial wage increase retroactive to July 1984; and a modified COLA clause which provides that COLA's are

Table 3. Average compensation (wage and benefit costs) adjustments in settlements covering 5,000 workers or more in private industry, 1985

[In percent]

Industry	First-year adjustments	Annual adjustment over life of contracts	Number of workers (thousands)[1]
All industries	2.6	2.7	1,413

Table 4. Effective wage adjustments in collective bargaining agreements covering 1,000 workers or more, 1979–85

Year	Total adjustment	Source		
		New agreements	Deferred from prior agreements	COLA
1979	9.1	3.0	3.0	3.1
1980	9.9	3.6	3.5	2.8
1981	9.5	2.5	3.8	3.2
1982	6.8	1.7	3.6	1.4
1983	4.0	.8	2.5	.6
1984	3.7	.8	2.0	.9
1985	3.3	.7	1.8	.7

to be paid only to the extent that they exceed the specified wage increases.

Wage adjustments effective in 1985

Wage adjustments put into effect in 1985 resulted from settlements during the year; deferred changes made under agreements negotiated in earlier years; and cost-of-living provisions.[5] Each of these components was at or near its lowest level for this series. (See table 4.) Combined, they resulted in an average effective wage adjustment of 3.3 percent for the 7 million workers under major contracts, the lowest adjustment since the series began in 1968. About 1.4 million workers received no wage adjustments; the remaining 5.6 million received adjustments which averaged 4.1 percent.

The following tabulation shows average wage adjustments (in percent) effective in 1985 for workers receiving one or more wage changes and prorated for all workers:

	Workers receiving wage changes	*All workers*
All adjustments	4.1	3.3
New settlements	3.4	.7
Deferred from prior settlements	3.7	1.8
COLA	2.2	.7

Workers can receive wage changes from more than one source; thus the size of the average change for workers receiving changes (4.1 percent) is larger than any of its parts.

The prorated cost-of-living adjustment averaged 0.7 percent in 1985, up slightly from the 1983 low of 0.6 percent. The size of adjustments is determined by movement in the CPI, frequency of reviews, and the adjustment formula used. Thus, the size of the COLA component is affected by the decline in COLA coverage, the moderate inflation rate, and the negotiation of less generous formulas.

About 2.8 million workers had cost-of-living reviews in 1985; 2.3 million received increases averaging 2.2 percent; approximately 400,000 had at least one review that yielded no wage change; and none had decreases resulting from COLA's. Wage adjustments stemming from 1985 reviews offset about 58 percent of the rise in consumer prices, compared with 50 percent in 1984.

Effective wage changes in major collective bargaining agreements are reflected in the Bureau's Employment Cost Index (ECI), which measures the change in the price of labor, free from the influence of employment shifts among industries and occupations. The wage and salary series of the ECI is limited to straight-time average hourly earnings, including production bonuses, incentive earnings, and COLA's, and excluding employer costs for employee benefits. The ECI wage and salary component is conceptually similar to the effective wage adjustment measure for union workers covered by the major collective bargaining agreements series, but provides data on *both* union and nonunion workers.

The ECI wage and salary component shows that in private industry, the cost of wages and salaries rose 4.1 percent from December 1984 to December 1985, matching the lowest 12-month change recorded in the 9 years such data are available. Continuing the relationship that began in 1983, wages increased less for union (3.1 percent) than for nonunion (4.6 percent) workers during the year ended December 1985.

THERE IS LITTLE ON THE HORIZON to suggest that 1986 bargaining results will be very different from those in 1985. For a discussion of the outlook for bargaining in 1986, see "Collective bargaining during 1986: pressures to curb costs remain," in the January 1986 *Review*. ☐

FOOTNOTES

[1] The major collective bargaining agreement series for private industry covers 7 million workers in bargaining units with at least 1,000 workers. For definitions of terms, see Current Labor Statistics, Wage and Compensation Data, p. 65. Additional tabulations from this series appear in the April 1986 issue of the Bureau's *Current Wage Developments*.

[2] Adjustments under settlements reached in the period and effective within 12 months of the contract effective date.

[3] Adjustments under settlements reached in the period expressed as an average annual (compound) rate over life of contract.

[4] For details of these settlements, see George Ruben, "Labor and management continue to combat mutual problems in 1985," *Monthly Labor Review*, January 1986, pp. 3–15.

[5] To calculate the effective adjustment and each component for workers receiving wage changes, each percent change in wages is weighted by the number of workers receiving the change, then the total worker-weighted change is divided by the number of workers receiving the changes. The prorated adjustment is calculated by dividing the total worker-weighted change by the total number of workers covered by major agreements. Therefore, the size of the average adjustment and each of its components reflects both the size of each change and the number of workers it affects.

The business services industry sets pace in employment growth

Industries which provide services to businesses for a fee or on a contractual basis have had rapid gains in employment growth over the last decade, especially firms supplying computer and data processing services and temporary help; expansion is expected to continue

WAYNE J. HOWE

Just as businesses purchase raw materials, machinery, or office equipment from suppliers, they also purchase services. These services may be highly technical, such as the development and sale of specialized computer software programs, or they can be more mundane, such as building cleaning and maintenance. Also, the need may be year round, such as for payroll processing, or temporary, such as for a fill-in receptionist. In any case, the use of contractors to supply certain types of services gives an employer considerable flexibility, and often is less expensive than hiring permanent employees to provide the same services. Business services is the fastest growing industry in the economy, and, while still small in the aggregate, may be representative of changes in the way many American companies are doing business.

The business services industry is made up of seven major industries:[1] advertising; consumer credit reporting and collection; mailing, reproduction, and stenographic services; services to buildings, including cleaning, maintenance, and exterminating services; personnel supply services, which includes both temporary help supply companies and employment agencies; computer and data processing services; and miscellaneous business services, which offer research and development, management and consulting, and protective services. These industries supply a variety of services to business establishments on a fee or contract basis. The heterogeneous mix of individual industries is also reflected in the diverse occupational distribution of employment in business services, which includes highly skilled managerial and administrative occupations, as well as lower skilled service occupations.

With employment doubling, the rate of job growth in business services over the past decade was more than four times that for all private nonagricultural industries. The growth of individual industries varied widely: employment in computer and data processing services and personnel supply services more than tripled, while moderate growth occurred in advertising; mailing, reproduction, and stenographic services; and services to buildings (although each of these industries grew much faster than the economy as a whole). Credit reporting and collection was the only business services industry that failed to increase its work force.

Wayne J. Howe is an economist in the Division of Employment and Unemployment Analysis, Bureau of Labor Statistics.

This article examines the rapid growth in the business services industry, particularly the computer and data processing and personnel supply services industries. It discusses the type of services offered by business services industries, the extent and nature of the employment expansion, and the occupations and earnings of the work force.

The data are from the Current Employment Statistics (CES) survey, the Current Population Survey (CPS) and the Occupational Employment Statistics (OES) survey.[2] The CES survey is generally recognized as the major source of current information on employment by industry. CES statistics are derived from a sample survey of business establishments, designed to provide industry information on nonagricultural wage and salary employment, average weekly hours, average hourly earnings, and average weekly earnings. Data derived from this survey are used whenever possible. However, the CES survey provides no demographic information except gender, and no occupational information at all. The CPS is used to provide information on job tenure and self-employment. Occupational distributions of employment are available from both the OES survey and the CPS. For this article, detailed OES employment data were aggregated into the major occupational groupings used in the CPS, which were used for economy-wide comparisons.[3]

Computer and data processing services

The greatest employment growth in business services between 1974 and 1984 took place in computer and data processing services, which grew by more than 250 percent. While the rate of employment gain in computer and data processing services throughout the economic downturns was much less than during expansionary periods, job gains continued even during the downturns. (See table 1.) This illustrates the relative insensitivity of this industry to changes in the business cycle. Computer and data processing services comprises two main components—data processing and programming services. Growth in data processing services depends on businesses using outside firms for data processing, whereas computer programming and other software services depends on businesses using their own systems.

Enterprises in data processing services provide such services as data entry, processing and preparation of reports from data supplied by clients, leasing or renting of computer time, and management and operation of the computer and data processing facilities of firms. Some data processing services organizations operate computer centers at which they process data on a periodic basis for firms that supply their own computer programs, and simply purchase computer power. Data are submitted by some of these customers via remote-batch terminals, and output is received on the same terminals. Other customers are time-sharing users who use their own computer terminals to solve relatively small business problems, utilizing the power supplied by the service organizations' mainframe computer.[4]

Table 1. Average annual rates of employment change in private nonagricultural and selected business services industries during business cycles

Business cycles[1]	All private nonagricultural industries	Personnel supply services	Computer and data processing services
Recessionary periods:			
November 1973–March 1975	−5.7	−13.3	11.0
January 1980–July 1980	.5	−1.8	4.4
July 1981–November 1982	−3.4	−8.7	28.5
Recovery periods:			
March 1975–January 1980	20.8	133.7	108.7
July 1980–July 1981	2.8	16.5	10.8
November 1982–June 1985	11.9	71.5	44.2

[1] Recessionary and recovery periods as designated by the National Bureau of Economic Research.

Many customers submit standard jobs for routine processing using computer programs supplied by the data processing service organization. In most cases, these firms are too big to perform their data processing manually, but it would not be cost effective for them to purchase or lease computer systems and hire operating staff. The requested services generally include payroll, accounts payable, and accounts receivable—the oldest types of services provided by data processing service organizations—and usually involve updating customers' private files in the course of processing input data and preparing output reports. The inception of on-line computer services has permitted access to public files (for example, airline, sporting, and theatrical reservation files, stock market transaction files, and U.S. census data) via software provided by the service organizations.[5]

During the late 1970's, design and production advances resulted in faster, cheaper, and more reliable computers. Less costly hardware has made it possible for many companies to purchase their own computers. As software became more user-friendly and hardware easier to use, the need for firms to contract for computer services diminished. Moreover, because traditional data processing activities such as accounting and financial analysis are now easily available using small computers and standard software packages, even companies that continue to contract for data processing services no longer seek such services to the same degree.[6] Evidence of this trend is the 16-percent employment growth in data processing services between 1982 and 1984, a relatively small growth compared with that in computer programming services (46 percent) during that period.

While many of the data processing service organizations that sell traditional time-sharing services have suffered a slowdown in growth, some have begun to offer specialized business services based on their own proprietary software. Companies that offer services to particular market niches such as hospitals and brokerage firms are experiencing rapid growth.[7] Moderate employment growth should continue in data processing services, along with greater overall acceptance of computer technology in the marketplace and continued innovations in data communications. As was the case in the past few years, growth should be tempered as computer hardware and software become more affordable, resulting in a larger proportion of firms which maintain their own computer systems.

The other major component of computer and data processing services is the computer programming and other software services industry. Included in this industry are firms which provide analysis and design for computer systems, development of computer programs or systems, computer programming services, and computer-related systems engineering. While only a third of the 475,000 workers in the computer and data processing services industry were employed in computer programming services in 1984, much of the long-run potential for substantial employment growth lies in this industry.

Unlike data processing service organizations, computer programming services firms have benefited from the introduction of mini- and micro-computers. Employment in computer programming services grew 46 percent between 1982 and 1984. As computer hardware dropped in price and performance improved, new applications for computers became feasible. The potential for more powerful, user-friendly computer software that can provide services such as financial statement preparation, profit analysis, and analytical management reports should increase the already strong demand for software services. Software is currently being written that appeals to both a broad group of users as well as a highly specialized market. The more computers and their applications proliferate, the greater will be the need for computer programming services.[8]

Within computer and data processing services, a disproportionate number of workers hold professional and technical jobs. There are almost twice as many professional specialty workers (such as computer systems analysts and electrical and electronic engineers) in this industry, compared with other business services industries. (See table 2.) The number of technicians (such as computer programmers) is almost three times the proportion found within all business services and seven times the average proportion for all industries. Because of the fast-moving technologies in this high tech industry, there is a great demand for technicians and programmers who are familiar with the latest computer technology.

Personnel supply services

The second fastest employment growth within business services between 1974 and 1984, at 211 percent, was achieved by personnel supply services. During the first half of this period, the average annual rate of growth was about 20 percent. This rate dropped off between 1979 and 1981, and employment actually declined during the 1981–82 recession. Between 1982 and 1984, however, employment grew 50 percent. Personnel supply services has a much larger ratio of administrative support workers, compared with other business services industries, and, at 42 percent in 1984, had more than twice the share of clerical employment than the average for all industries. Personnel supply services comprise two components, temporary help supply services, which accounts for three-fourths of the industry employment, and employment agencies.

Temporary help supply services consists of businesses primarily engaged in supplying temporary help to other establishments on a contractual basis. (See accompanying article.) The employees remain on the payroll of the temporary help supply agencies, but are placed under the direct or general supervision of the firm to which they are supplied. Unfortunately, the CES survey cannot determine the industries in which temporary employees actually work because they appear on the payrolls of the individual temporary help supply agencies. Therefore, employment growth in the user industries is understated.

Overall, there was a 57-percent employment increase in temporary help supply services between 1982 and 1984, the largest growth of any industry in the economy over the 2-year period. To some degree, the employment boom since 1982 in temporary help supply services can be attributed to the post-recession economic recovery. Table 1 shows employment growth in personnel supply services, both during

Table 2. Occupational distribution of nonagricultural employees in the business services industry, 1984

[In percent]

Occupation	All nonagricultural employees[1]	Business services							
		Total[2]	Advertising	Credit reporting and collection	Mailing, reproduction, and stenographic	Services to buildings	Personnel supply	Computer and data processing	Miscellaneous business services

Services, except private households	13.9	26.3	.4	.9	.7	88.3	9.9	.5	25.6
Precision production, craft, and repair; operators, fabricators, and laborers	30.0	14.2	7.5	.7	25.4	2.9	25.2	4.9	15.8

[1] Data are from the Current Population Survey, annual averages.

[2] Data are from the Occupational Employment Statistics survey, June 1984.

[3] Less than 0.1 percent.

and after the last three recessionary periods. During post-recessionary periods, employment growth in personnel supply services was much stronger than in all private nonagricultural industries. Such strong employment growth indicates that although some of the increase is due to a change in how firms handle business office functions, much is due to real growth.

Many businesses exercise caution as they emerge out of a recession, choosing to hire temporary employees rather than risking a long-term investment in permanent hires. The temporary help industry provides customers with trained personnel, and the customers pay the temporary help supply agencies an hourly rate above that paid to the temporary workers. Companies which use these agencies to meet their short-term needs can test the market to see if job expansion is prudent.[9] If unfavorable market conditions call for a reduction in labor costs, it is easier and less costly to cancel the contract for temporary help. Also, if managers are unsatisfied with the performance of a temporary worker, they can simply request a replacement. If favorable market conditions warrant the hiring of permanent employees, the firms may offer temporary workers a permanent position, with the added advantage that those employees are already familiar with their business techniques. However, contracts between temporary help supply agencies and their customers may limit this practice.

The use of nonpayroll employees allows the latter to avoid many of the costs associated with employment, such as payroll processing, as well as those of health and unemployment insurance, workers' compensation, sick and vacation leave, and pensions.

Temporary help workers perform a variety of jobs. They can be service workers earning the minimum wage or highly paid technicians or administrators. The largest number of temporary workers are employed as general office clerks, secretaries, and typists. There is a particularly large number of typists experienced with word processing equipment in this industry. To get the most from already purchased office equipment, companies are now competing for typists trained in word processing skills. Given the rate at which word processing systems are being installed, the demand for these workers is likely to continue into the near future.

Other prominent temporary supply services occupations are related to the rapidly expanding health care industry. There are sizable numbers of registered and licensed practical nurses, as well as other health care professionals and technicians, employed as temporary help workers. Employment opportunities for these health care specialists is due, in large part, to the considerable expansion in medicare and medicaid insurance coverage for home health care in the last decade.[10] To cut health care costs, health insurance coverage now often includes the cost of skilled home health care nurses, therapists, and technicians. Most home care agencies are small, independently owned businesses, but, because of fierce competition and economies of scale, large national companies have increased their share in the market over the decade.[11] Both large and small home health care organizations supply health service workers to customers on a contractual basis.

Most employees stay with a temporary supply service for only a short time, although some stay for years. Just as businesses use temporary help to test the market, temporary workers can shop for a permanent position in a recovering economy, sampling a range of work environments until they find the right employment situation, while gaining self-confidence and job experience. Workers not actively seeking permanent positions may be attracted to the competitive wages and the flexible hours provided by temporary employment, especially workers with family or other personal responsibilities.[12]

The increasing number of business establishments that are computerizing their operations has created a demand for workers with computer-related skills over the decade. Temporary help supply agencies recruit and train workers for staff positions that this new office technology creates.[13] As noted earlier, the largest number of workers on the payroll of such agencies are secretaries with word processing skills. In addition, the agencies lease systems analysts and other professional and technical specialists to companies on a per-project basis. The number of these professionals is still very small, however, as most of such work is handled by the computer and data processing industry. Strong demand for temporary workers who are familiar with computer technology should continue along with the growth in computer applications.

Employment agencies, the other component of personnel supply services, consists of firms that assist employers looking for staff or individuals seeking employment. This industry includes placement services, labor contractors, and maid, model, nursing, and teacher registries. Unlike temporary help supply services firms, they do not employ workers for contracting out to establishments, but match job applicants and job openings for a fee, which is paid by either the employer or by the job applicant. Employment agencies are cost-effective sources for locating experienced and skilled personnel. Many agencies promote specialized occupations, such as data processing, clerical, technical, managerial, executive, or engineering. Nevertheless, the staffs of these agencies are concerned with placement-related activities or support, so their occupational range is limited. The most prominent managerial occupation in this industry is employment interviewers who interview, select, and recommend applicants for job openings. Much of the growth potential in this occupation, where women make up the majority of employees, should occur as employers try to provide effective employee relations for an expanding and aging work force.[14] Overall, employment in this component of the industry increased 30 percent between 1982 and 1984, as economic recovery led to increased hiring.

Other business services

Mailing, reproduction, and stenographic services also had strong employment growth (89 percent) between 1974 and 1984. Firms engaged in direct mail advertising, compiling and selling mailing lists, and providing typing services are included in this industry. Word-processing services are also offered by these establishments to both individuals and firms that do not own or operate their own computer system. Future employment growth will probably not be as strong as in the past 10 years, as microcomputer cost declines and packaged computer programs make it easier for firms and individuals to own and operate their own computer systems, displacing some of the services provided by this industry.

Services to buildings industry includes establishments which offer cleaning, disinfecting, and exterminating services to business establishments and homeowners. Employment in this industry grew 55 percent over the 1974–84 period. Employment among janitors and cleaners—the industry's major occupational group—has increased over the decade. Because pay is relatively low and advancement limited, job turnover is high, creating many of the openings for these workers. Job gains over the next decade are projected to grow more rapidly than other services industries, partly due to planned growth in the number of office buildings, apartment houses, and private dwellings.[15]

Advertising industry's employment increased 48 percent between 1974 and 1984. Employment opportunities were particularly strong for sales agents, advertising and public relations managers, and artists. Overall, job growth in advertising during the last decade was below that of other business services industries, but was still more than twice as large as the average growth in all industries throughout the economy.

Miscellaneous business services is the largest segment of the business services industry, accounting for more than 40 percent of all employment. Included in this industry are such diverse components as management, consulting, and public relations services; protective services; and research

Table 3. Ten most prominent occupations in the seven business services industries, June 1984

Industry and occupations	Percent of industry employment
Advertising:	
Sales agents, advertising	10.4
Marketing, advertising, and public relations managers	9.8

NOTE: Data are from the Occupational Employment Statistics survey, June 1984.

and development laboratories, that provide employment for a wide range of occupations. Betweeen 1980 and 1984, employment grew by 25 percent in miscellaneous business services,[16] and the growth rate is expected to continue to lag behind the rest of business services.

Credit reporting and collection was the only business services industry that failed to register job gains between 1974 and 1984. About 8 of 10 employees in this component of the business services industry are clerical workers. (See table 3.) The increase in office automation systems over the decade made it easier for the firms themselves to acquire information formerly provided by this segment, and may have resulted in the elimination of many administrative support jobs related to accounts reporting and collection.[17]

Characteristics of employment growth

Overall, women accounted for 46 percent of the business services work force in 1984, up from 39 percent in 1974, as their job growth outpaced gains for men. (See table 4.) Only two business services industries did not increase their share of women during that period—credit reporting and collection and computer and data processing services. The decrease in the share of employment for women in computer and data processing services was primarily due to that industry's increased emphasis on high tech occupations, which are dominated by men.

Women make up the majority of workers in credit reporting and collection, advertising, and personnel supply services. More than 60 percent of the personnel supply services work force are women, reflecting this industry's greater employment of administrative support personnel and nurses, occupations dominated by women. Within personnel supply services, there are more women than men in both employment agencies and temporary help supply agencies; however, since 1982, job gains for men have been stronger in both industries. In fact, growth for men in employment agencies was almost four times that for women. The future structure of business services may be determined by the relative employment gains of the two large growth industries—computer and data processing, where employment is dominated by men, and personnel supply services, where employment is dominated by women.

Self-employed workers constitute a rapidly growing segment of the business services industry. Over the 1974–84 period, self-employment more than tripled—from 190,000 to 575,000; women accounted for most of the growth. To the extent that female employment is growing more rapidly than male employment in the business services industry, the increase in self-employed women could be expected. Nevertheless, the growth in self-employed women over the decade may also indicate an expansion in the employment opportunities that women are creating for themselves.[18]

Weekly earnings

Historically, the weekly earnings of workers in the business services industry have been somewhat lower than the average for all industries.[19] Between 1974 and 1984, however, the 105-percent increase in average weekly earnings in business services outpaced the 90-percent average gain for all industries. In 1984, business services employees averaged $266.45 a week, compared with $294.05 for all private nonagricultural industries and $250.59 for the services division of the service-producing sector of the economy.

The earnings in business services reflect, among other factors, the occupational mix, which, despite a large representation of managers and administrators, also has a large concentration of low wage service and clerical workers.[20]

Table 4. Percent distribution of production or nonsupervisory employees in the business services industry, 1974 and 1984 annual averages

Year and sex	Total[1]	Advertising	Credit reporting and collection	Mailing, reproduction, and stenographic	Services to buildings	Personnel supply	Computer and data processing

[1] Includes miscellaneous business services, not shown separately.

NOTE: Data are from the Current Employment Statistics survey.

The industry also has a very low incidence of unionization. With respect to the occupational structure, there is a relatively large proportion of clerical and service workers in business services. Fifty-four percent of the business services work force are employed in these two occupational groupings, where weekly earnings are relatively low compared with all workers. Owing to a vast difference in the occupational structure of the industry, there is a wide range of average weekly earnings within business services. For example, average weekly earnings in computer and data processing services increased by 120 percent to $411.18 over the 10-year period studied, and were 40 percent greater than the average for all industries in 1984. This is not surprising, given that more than half of the workers in this industry are relatively highly paid administrators, managers, professionals, and technicians. In contrast, average weekly earnings in the services to buildings industry, at $177.41, were 40 percent below the average for all workers. Eighty-eight percent of the workers in the services to buildings industry were in occupations with relatively low wages, such as janitors and cleaners.

As for unionization, workers who are members of unions tend to earn higher wages than nonunion members. In 1984, union members earned, on average, $103 more per week than their nonunion counterparts.[21] Part of the earnings gap between business services and other industries may be related to the fact that only about 6 percent of business services employees were union members in 1984, about 10 percentage points below the average for all U.S. industries.[22]

Tenure and hours

Job tenure is a measure of the length of time an employee has worked continuously for the same employer, although not necessarily in the same occupation.[23] Tenure is generally terminated when a person transfers to a job in a different firm, is laid off for 30 days or more, or enters the Armed Forces. Firms in growing industries usually hire new workers as they expand and, therefore, show relatively low levels of job tenure. Establishments in industries where employment is stagnant or declining do not hire as often, letting positions expire as they become vacant. If a reduction in personnel is required, it will generally be concentrated among persons with the least seniority, which increases the average level of job tenure among those still in the industry. Median job tenure in the rapidly expanding business services industry, as of January 1983, was a relatively low 2.7 years, compared with 4.3 years in all industries.

The comparatively short job tenure for business services employees also reflects the large number of temporary workers in this industry, a result of employment gains in personnel supply services. Another factor affecting job tenure is the relatively large proportion of women. Median job tenure for men was 3.0 years, compared with 2.5 years for women. Only retail trade and private household services, where larger numbers of women are employed, had lower median job tenure.

Not only do workers in business services tend to work for shorter periods for any specific employer, but they also tend to work fewer hours. However, whereas average weekly hours of employment for workers in all industries dropped by 3 percent between 1974 and 1984, average weekly hours of employment in the business services industry increased by 1 percentage point.[24] At 33.6 hours, there is still a gap of 1.7 hours between business services and the average for all industries. A major reason for the narrowing gap was a weekly hours increase of nearly 5 percent to 38.5 hours in computer and data processing services, 3.2 hours more than the average for all industries. In contrast, average weekly hours of employment in services to buildings, where part-time work is typical, was a very low 28.8 hours; even so, weekly hours increased by 4 percent over the decade.

Continued expansion expected

The relative growth of business services employment was particularly rapid in the last 10 years, as firms acquired a greater appreciation of the variety of services that could be provided. Many establishments began contracting out for new specialized business services or for services that formerly were either taken care of inhouse or were neglected, when they realized that these services could be supplied at less expense and more efficiently by business services organizations. Agencies that supply temporary employees also provide customers with the flexibility to meet their short-term employment needs. The strong trend toward the use of outside companies to supply business services is expected to continue. Therefore, job expansion in business services should surpass that of other industries in the future, although prospects for growth in the heterogeneous mix of individual business services industries vary widely. ☐

FOOTNOTES

[1] BLS and other Federal and State agencies follow as closely as possible the Office of Management and Budget's 1972 *Standard Industrial Classification (SIC) Manual* to define and classify industries in the U.S. economy. Business Services (SIC 73) has seven component industries: advertising (SIC 731); consumer credit reporting and collection (SIC 732); mailing, reproduction, and stenographic services (SIC 733); services to buildings (SIC 734); personnel supply services (SIC 736); computer and data processing services (SIC 737); and miscellaneous business services (SIC 739).

[2] The Current Employment Statistics survey is a monthly survey that samples approximately 270,000 establishments employing more than 35 million people. It counts only wage and salary employees whose names appear on the payroll records of nonagricultural firms. The Current Population Survey reflects a larger segment of the population, although based on a smaller sample of approximately 60,000 households. Information is obtained each month for approximately 120,000 individuals 16 years and over and includes, in addition to nonagricultural wage and salary employment, agricultural employment, the self-employed, unpaid family workers, private household workers, as well as the unemployed, and persons not in the

labor force. For a detailed comparison of the two sample series, see Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. The Occupational Employment Statistics survey is a periodic mail survey conducted by State employment security agencies of a sample of nonfarm establishments to obtain wage and employment information by occupation. These data are used to estimate total employment by occupation for the Nation, for each State, and for selected areas within States. The reference period of the current OES survey was the week that included June 12, 1984.

Employment growth in the temporary help industry

The number of employees rose by 70 percent from November 1982 to November 1984, making the industry the fastest growing among those with employment over 50,000

MAX L. CAREY AND KIM L. HAZELBAKER

Few industries have grown faster in recent years than the temporary help supply industry. Although still small in overall terms, with 735,000 workers representing less than one percent of total wage and salary employment in nonagricultural establishments in December 1985, the industry almost doubled in employment size in the 3 years since the trough of the recession in 1982 and accounted for 3 percent of the total job growth. Indications are that rapid growth of employment in the industry will continue through the mid-1990's.

As part of an ongoing Bureau of Labor Statistics study of the service-sector portion of the economy, this article documents the job gains recently experienced in the industry, and discusses reasons for the increase in demand for temporary workers and factors leading to the growth in supply of workers for temporary jobs. It also discusses differences in the occupational segments of the temporary help market. The article primarily uses data from the Current Employment Statistics survey and data from reports covered by unemployment insurance programs [1] It also is based on information obtained through interviews with temporary help supply firms and their customers.

How the industry works

The temporary help supply industry (SIC 7362) is made up of establishments primarily engaged in supplying temporary help to other businesses. In exchange for providing an employee to a customer, the temporary help firm charges an hourly rate which is equal to the worker's wage plus the firm's markup for its service. The workers are under the supervision of the businesses to whom they are furnished; however, they are on the payroll of the supplying establishment.[2] Temporary help companies recruit and screen applicants for temporary jobs, check references, administer tests to help determine qualifications, and in some cases provide training. They have full responsibility as the employer even though the employee is working at the customer's place of business. They hire and fire, issue paychecks, withhold payroll taxes, and make required employer contributions to programs such as unemployment insurance and Social Security. They also are liable under laws intended to protect the health and safety of workers and assure equal employment opportunities.

Sources of demand

Employers frequently experience short-term changes in their need for workers because of seasonal fluctuations or other factors. The absence of permanent employees for vacation or illness may also create a need. Overtime work can be a solution, but for some businesses it may not be practi-

---

Max L. Carey is an economist in the Office of Economic Growth and Employment Projections, Bureau of Labor Statistics. Kim L. Hazelbaker is an economist formerly in the Office of Employment and Unemployment Statistics. Elinor W. Abramson and Daniel K. Wexler of these offices provided technical assistance.

cal. Overstaffing is another way to assure that a sufficient number of employees will be available at peak periods, but carrying workers who are underutilized much of the time is wasteful. Generally, a less expensive solution is the use of workers from outside the company on an occasional basis as needs arise. The use of temporary workers may be particularly attractive to organizations with high fringe-benefit costs.[3] One of the more pronounced trends in labor costs over the last several years has been the increase in the relative importance of employer-paid benefits. For example, between June 1981 and December 1985, wages increased 27.0 percent, but total compensation costs, including employer costs for employee benefits, rose 29.2 percent.[4] Traditionally, temporary employees have fewer benefits than permanent employees and therefore lower benefit costs.

Uncertainty about the economic climate also can increase employers' preferences for temporary labor. For example, dramatic changes in the overall business climate during the early 1980's made employers less certain about the future course of economic events and, therefore, less willing to bring on additional permanent staff to deal with increases in orders that they thought might be only temporary. In particular, the far-reaching negative experiences of the large layoffs and deep staff cuts undertaken during the 1981–82 recession influenced many employers' staffing decisions in the following recovery. To many employers, the vow to stay "lean-and-mean" has particular implications for the use of temporary help versus permanent staff.

Sources of supply

For some people, temporary jobs are a stopgap until they find a permanent job. Others seek temporary jobs because they want the schedule flexibility that will allow time for activities such as taking care of children or attending school. Clearly the continuing increase in the labor force participation rates of women, many of whom combine work and family responsibilities, has contributed to the available pool of people seeking these jobs. Temporary jobs also can be attractive to retirees and other workers who want more leisure time. In addition, these jobs can be a way of keeping skills up to date or trying a variety of employers.

Although employers and individuals seeking temporary jobs often deal directly with each other in the labor market, both parties may benefit from using the temporary help firm as an intermediary. For short-term jobs, the markup for the service usually is lower than the customer's cost of recruiting a person and putting him or her on the payroll. These firms can also fill orders quickly because they maintain contact with large numbers of qualified personnel who will take brief assignments on short notice. In addition, the consequences of getting an unsatisfactory worker are less onerous because the customer can simply request a replacement. For workers who are looking for temporary assignments, the firm can reduce job-search costs. Finding a job on one's own can be costly in terms of time and money and may not make sense if it is to last only a few days. Using this service can mean more time working and less time looking.

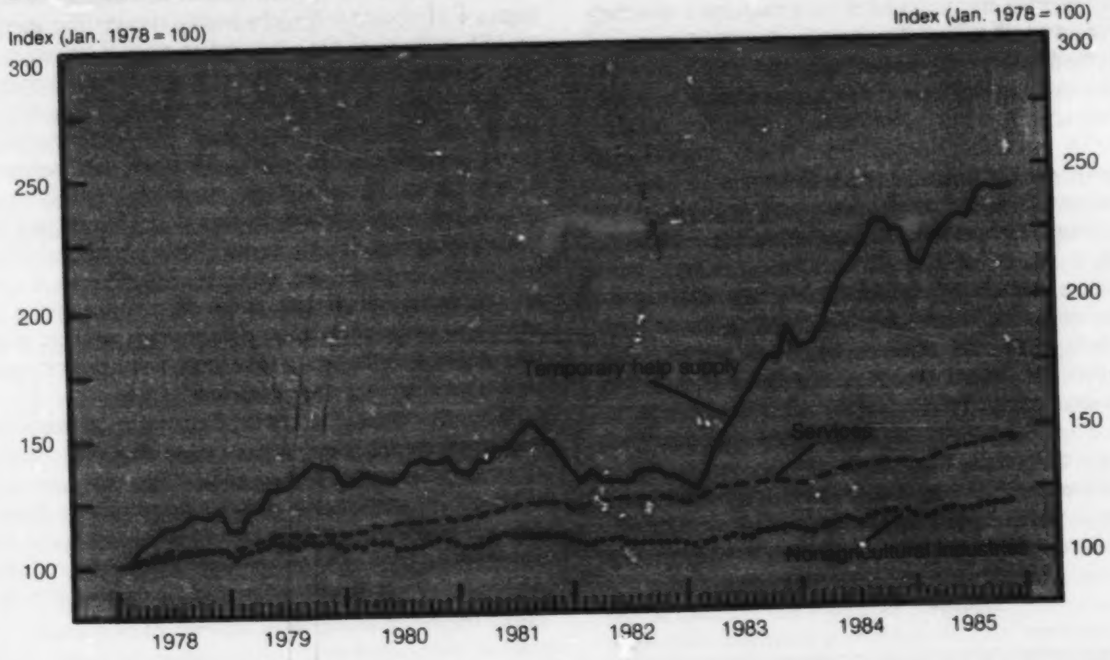
Occupational markets

Establishments in the temporary help industry usually specialize in one of the following four markets: office, industrial, medical, or engineering and technical. Many establishments that are primarily suppliers of office help, however, also supply industrial workers. Those providing medical workers or engineering and technical workers are more likely to specialize exclusively in these fields. Some of the large firms in the industry are involved in more than one market and have separate subsidiaries or divisions to deal with each.

Occupational data are not available specifically for the industry, but its staffing pattern can be approximated from data on the personnel supply services industry group (SIC 736) of which it is a part. The temporary help industry made up about three-quarters of this group's employment in 1985; employment agencies (SIC 7361) accounted for most of the remainder. Analysis of the Bureau's 1984 industry-occupation matrix indicates that office occupations accounted for more than one-half of total employment in personnel supply services, industrial occupations, almost three-tenths, and medical occupations, about one-tenth. Only a small proportion of the employment was in engineering and technical fields.[5] The magnitude of employment in the latter occupations, however, may be much greater than the data would imply because many establishments that furnish temporary help in engineering and technician occupations apparently are frequently classified in the engineering and architectural services industry rather than in the temporary help industry.[6]

Office market. This market consists mostly of clerical workers such as secretaries, typists, receptionists, computer operators, and general office clerks. However, it also includes accountants and marketing and sales workers. Most industries use temporary office workers. Among the largest users are the following major industry groups—services; wholesale and retail trade; manufacturing; and finance, insurance, and real estate. Many office jobs can be filled by temporary workers because the basic skills needed for particular occupations do not vary much from one employer to another. Customers usually are very specific about requirements for assignments. For example, in placing an order, a company may specify that it needs one typist skilled in preparing statistical tables to assist on a rush project and another who can type more than 60 words per minute to substitute for a permanent employee who is recovering from an illness. The demand for temporary workers in office jobs generally is less sensitive to seasonal and cyclical changes than the demand for industrial workers and engineering and technical workers. Customers usually need experienced

Chart 1. Comparison of employment growth indexes in the temporary help, services, and nonagricultural industries, 1978-85



workers because they cannot afford to train persons for short assignments. Temporary help firms typically strive to ensure that all workers on their rolls meet specified minimum skill levels. Normally this is accomplished through clerical skills testing. Certification of the temporary employees' skills is felt to be quite important in the office market. In general, the firms do not offer skills training to applicants but prefer to deal with already trained and experienced personnel. However, when the local labor market is tight, they may sponsor clerical training classes in order to increase the pool of trained applicants. Some firms also provide basic and advanced instruction on word-processing equipment and personal computers.

The temporary help office market is dominated by relatively large, multi-establishment companies, some national in scope. They compete quite vigorously with one another within large metropolitan labor markets. Factors in the predominance of large firms include the customers' need for quick action on the filling of job-orders for temporary clerical and other office help. Typically, orders are placed at least one day in advance, but some orders are for personnel to report in a few hours. This fast turnaround necessitates a large and current file of clerical help available for almost instantaneous referral to customers' worksites.

Many workers with office skills are not looking for regular, full-time employment. A large number are mothers who want to schedule work around family responsibilities. Some are schoolteachers who supplement their income by working during summer. Others are recent college graduates who need some income until they find employment related to their studies. Temporary help companies try to accommodate preferences for particular days or hours of work, and the frequency and duration of assignments. Some of their employees, however, are seeking permanent jobs, and the temporary assignments can lead to these jobs.

The transfer of an employee from a temporary help firm's payroll to a customer's payroll is called a "T-to-P" conversion—that is, the hiring, on a permanent basis, of temporary workers supplied by the firm. This practice is thought to be more common for office workers than other occupations, although it also occurs with industrial workers. A potential exists for the customer to use the firm as a screening and placement tool, but without the associated agency fees. The firms deal with this dilemma in a variety of ways. Those which are active in both the temporary help market and the placement market simply charge the customer a negotiated placement fee. Others specify that in "T-to-P" conversions the customer will be billed for a certain minimum number of hours for the worker involved. Some specify the payment of a liquidation fee. A ban on the permanent hiring of temporaries for some period of time after their use is sometimes contained in contracts between the supplying firm and the customer.

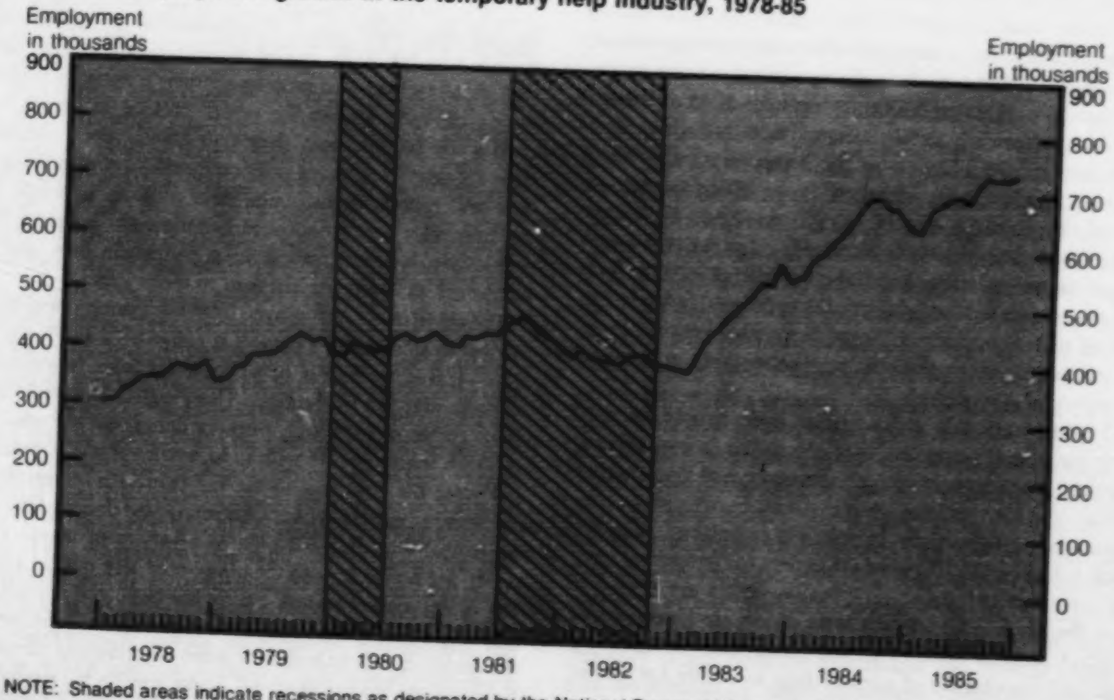
As a general rule, in a given labor market, temporary clerical workers are employed at lower wage rates than their permanent counterparts. The total hourly cost to the customer for the temporary worker, however, may be as much or more than the total hourly cost of the customer's permanent workers.

Industrial market. A large proportion of the employees in the industrial segment of the temporary help market are helpers, laborers, and material movers, and many others are service workers, such as food and beverage preparation workers. Little, if any, work experience is necessary for most of these jobs. Other occupations include truck drivers, machine operators and assemblers, and craft workers. Customers for industrial temporaries are found in many industries—wholesale and retail trade, construction, manufacturing, and transportation are major users. The reason for using industrial temporaries frequently is work overloads. For example, a manufacturer or wholesaler may need extra help to unload an unusually large shipment. A building contractor may need workers to assist in cleaning up around a project. Absences of regular employees also may be a reason. The demand for industrial workers probably is more sensitive to seasonal and cyclical influences than the need for other temporary personnel.

Rates of pay for temporary workers in industrial occupations are low because the jobs usually require little training or skill. At the same time, the markup charged for supplying these workers tends to be high because the menial nature of the jobs results in a very large turnover, which adds to recruitment and administrative costs. The transportation of employees also may be a cost. To make sure customers receive the number of workers requested, some firms require employees to report to their offices each morning instead of going directly to customers' premises. Work crews are then assembled, transported to the jobs in company vehicles, and returned to the office at the end of the day. As a result of these costs, temporary workers in the least skilled jobs frequently have much lower pay rates than regular employees in the same kinds of jobs.

Although many of the industrial employees of temporary help firms are interested only in occasional employment, others see temporary assignments as stepping stones to higher paying regular jobs with the most desirable companies. Employers do hire temporaries who have demonstrated that they are good workers, but the demand for unskilled workers usually is much smaller than the number of people

Chart 2. Employment growth in the temporary help industry, 1978-85



NOTE: Shaded areas indicate recessions as designated by the National Bureau of Economic Research.

seeking the jobs. Many firms do not seek payment of liquidation damages from customers that hire their industrial employees.

Medical market. Registered nurses and licensed practical nurses represent most medical employees of the temporary help industry. Some employees also are nursing aides, orderlies, and attendants. The industry is relatively new to the medical market, having emerged during the 1970's when hospitals were faced with shortages of registered nurses attributed, in part, to population growth and greater coverage under health insurance programs. It provided an alternative to traditional sources of personnel for temporary duty—nursing registries which find assignments for self-employed nurses for a fee and on-call pools operated by hospitals and other health care institutions for their own needs.[7]

The principal users of medical personnel supplied by the temporary help industry are hospitals, nursing homes, and private households (home health care). Temporary workers are needed by hospitals and nursing homes to fill in for regular employees who are on vacation, ill, or absent for other reasons. A surge in a hospital's patient population as a result of an epidemic or disaster would temporarily increase the need for personnel too. In addition, temporaries have been used to alleviate shortages of registered nurses. Assignments in hospitals and nursing homes may be for as little as one work shift, but they are more likely to be for two or three days, and some last even longer. Temporaries may also get the least desirable shifts—evenings, nights, and weekends. Medical workers are needed in private households to care for patients who have been released from hospitals to recuperate at home or who have become too sick or frail to care for themselves. An assignment in a patient's home can be long term. The demand for medical temporary personnel is greatest during the summer, when many regular staff members take vacations and patients schedule elective surgery to coincide with their vacations. Use of temporary medical workers in hospitals is usually limited to registered nurses, while nursing homes and private households may use both registered nurses and licensed practical nurses, as well as nursing aides, orderlies, and attendants.

Temporary help companies generally hire only registered nurses and licensed practical nurses who have a year or more of work experience in their occupations. Nurses may want to limit work in order to care for children, attend school, or simply to have more leisure time. In some cases, they work primarily to keep their skills up to date instead of for the income. On the other hand, a small number of nurses have full-time jobs and moonlight to supplement their income. Firms in the industry usually provide malpractice insurance and bonding insurance; some also provide health insurance, life insurance, and other fringe benefits, but the benefits are less generous than those provided by hospitals and other institutions for their regular staffs.

Engineering and technical market. Businesses that specialize in this segment of the temporary help market frequently are called job shops. Most of their employees are engineers, designers, and nonmedical technicians such as drafters, engineering technicians, and computer programmers. Job shops provide essentially the same kind of services as other temporary help firms and charge for them in the same way. The scope of operation, however, may be national and even international, whereas companies that specialize in clerical, medical, or industrial temporary workers concentrate on local markets. An office in Boston, for example, may recruit engineers from New England for a customer in Los Angeles. Unlike other temporary help firms, the job shop generally does not select the applicant, but provides several resumes for the customer's consideration. Another thing unique about some job shops is that they offer in-house engineering and technical services—the work is done on their premises rather than on those of the customer. In-house work, however, accounts for only a small part of employment in this business.

A large proportion of job shop customers are in aerospace manufacturing, electronics manufacturing, shipbuilding and repairing, and other industries that depend heavily on defense work. Job shops serve a variety of other manufacturing industries, including producers of automobiles, industrial machinery, and chemicals. Organizations that contract to perform engineering services also are customers. The need for engineers and technicians on a temporary basis usually arises as a result of major projects to develop new products or facilities. An aerospace company may need additional personnel, for example, to help design a new aircraft and get it into production on schedule. An engineering services firm may require extra help on a contract to design and build a new plant for a customer. Employers also may turn to job shops when they are unable to recruit enough regular employees to staff a project. Relatively few engineers and technicians are employed temporarily to fill in for absent workers. Businesses frequently are able to anticipate their need for temporary personnel well in advance, and usually can estimate how long they will be needed. Assignments are of a relatively long duration—6 months to 12 months is typical, and up to 2 years is not uncommon. Temporary to permanent conversions usually do not occur during these assignments. The job shop may be able to place the employee with another customer when the assignment ends or the employee may take a permanent job elsewhere.

Engineers and technicians frequently can earn more take-home pay in temporary jobs than they can in regular jobs. Fringe benefits, however, usually are limited to paid vacations and holidays, and medical and life insurance at group rates. Although high pay probably is the main reason engineers and technicians seek temporary jobs, the variety of assignments and geographic locations also may be attractions. Not all of these workers are geographically mobile. "Freeway" or "subway" job shopper is industry parlance for the person who goes from one assignment to another in the same metropolitan area. A "road" job shopper is a person who is willing to relocate. Work experience usually is a requirement for temporary assignments in engineer and technician fields. Many job shoppers are single persons in their late twenties and early thirties. Married workers, particularly those with children at home, are less likely to seek these jobs. Compared with engineers and technicians in regular jobs, job shoppers are more likely to be laid off of an assignment as a result of cutbacks in defense or research and development expenditures.

Employment growth

Average annual employment in the temporary help industry grew from about 340,000 in 1978 to 695,000 in 1985, an increase of 104 percent, which was 3 times the rate of increase for the rapidly expanding services division and over 8 times the rate for all nonagricultural industries (chart 1). Employment in the industry reflected changing business conditions during this period. It increased significantly in 1978–79, slowed as the economy weakened in 1980, and then declined slightly during the 1981–82 recession (chart 2). At the trough of the recession in November 1982, the industry employed 400,000 workers, about 8.4 percent fewer than a year before. Employment increased 70 percent between November 1982 and November 1984; within a span of 2 years the industry had added about 280,000 workers to its payrolls. In fact, during these 2 years, temporary help was the fastest growing industry among those with employment greater than 50,000.[8]

The industry's employment expansion early in an economic recovery is related to the hesitancy of many employers to expand their own permanent staff until the upward course of business conditions has become more certain. Therefore, in order to adjust their work force to increases in product demand, employers turn to a variety of short-run strategies. These strategies may include increasing hours of work for those employees already on the payroll, subcontracting portions of work to other firms, hiring part-time or temporary workers themselves, and using employees of temporary help companies. There are a variety of causal factors at work and the exact mix of strategies used by any one firm or one industry depends on their relative importance. For some, the time needed to recruit, hire, or train additional workers may preclude the use of increased permanent staff. Other employers may have labor cost structures which inhibit, or labor contracts which limit, the use of greatly lengthened workhours. Many employers prefer not to subcontract additional work to other companies for obvious competitive reasons. Given these circumstances, the use of trained workers who are available on short notice from a temporary help firm is an attractive alternative to many employers. Indeed, the quick response of these firms to increases in the demand for workers is one of the most important attributes of the industry.

The initial cyclical expansion of temporary help employment tends to slow over time. The cyclical growth spurt associated with the most recent recovery ended in the fall of 1984. More modest growth has resulted in the addition of only 60,000 jobs in 1985 (chart 2). Even so, this 8.7-percent employment growth was nearly 3 times the rate for all industries in 1985. As the economic recovery matures, the use of temporary help is mitigated somewhat by employers' desires to hire full-time staff for their own payrolls. Several factors are at work here as well, including the realization that increases in business have become more certain and that there is a need for individual employers to compete for the available pool of trained labor. Therefore, employment increases in the industry that are solely attributable to the upswing in the business cycle tend to moderate during the later stages of recoveries.

Growth in the industry's employment has come principally from increasing numbers of establishments rather than from increasing establishment size. The number of reporting units in the industry rose from about 3,690 in the first quarter of 1978 to 7,750 for the same period in 1985, while the average number of employees per unit decreased slightly from 83.4 to 82.4. The increases in the number of establishments are largely attributed to what are perceived to be low barriers to entry and relatively small startup costs.

Temporary help industry employment varies substantially from State to State and from area to area. The States with above average growth rates tend to have higher proportions of the employment than those with below average growth. Many high growth States, such as Arizona, California, and Colorado have an incidence of employment in this industry that is about 50 percent higher than the Nation as a whole. The geographic relationship between high employment growth rates and concentration of temporary help mirrors the observation at the national level that the industry's growth is higher when the national economy is expanding.

Projected growth

The Bureau of Labor Statistics has developed three alternative sets of economic and employment projections for the U.S. economy for the year 1995. The macroeconomic assumptions underlying these projections, which consist of a high-growth, moderate-growth and low-growth scenario, were presented in the November 1985 issue of the *Review*.[9] Based on the moderate-growth case, employment in the temporary help industry is projected to increase an average of 5 percent a year between 1984 and 1995, faster than the 4.2-percent rate for business services as a whole and much faster than the 1.3-percent rate for all industries. Employment in the industry would reach almost 1,060,000 in 1995, a gain of about 430,000 jobs over the 1984 level. Under the high-growth and low-growth scenarios, employment levels are expected to range from about 1 million to 1.1 million in 1995. The projected growth rates are much slower than the increases experienced by the industry during the recovery from the recession, and more in line with the growth over the last year (December 1984 to December 1985).

Employment in office occupations is expected to grow about as rapidly as total employment in the temporary help industry. As the industry's customers automate offices, however, it should receive relatively more requests for temporary workers with the latest skills such as computer operators, peripheral equipment operators, and secretaries and typists who can operate word processors and personal computers. At the same time, office technology may result in relatively fewer orders for file clerks, mail clerks, and data entry keyers. Some temporary help companies see potential in "home based" offices for selected employees. Computerized equipment in the homes of these workers would enable them to transcribe material and produce printed copy in customer's offices miles away.

Employment of engineers and technical workers in temporary assignments may rise faster than total employment in the industry, at least through 1990. A large part of the growth in these jobs is expected to result from increased investment in capital equipment. An investment boom is projected because of expected lower real interest rates, the prospect of a stable economy, and the desire of manufacturers to take advantage of new technologies—purchases of which were postponed during the low-investment years of 1980–82. Growth also is expected in defense-related industries. Real defense purchases of goods and services are projected to increase 5.3 percent annually between 1984 and 1990, and then taper off. This spending should increase the number of temporary jobs for product design and related activities in the aircraft and guided missiles, ordnance, shipbuilding and repair, and communication equipment industries. If defense expenditures, however, are significantly different, job prospects will be altered.

Industrial jobs are expected to grow slower than the industry's employment as a whole. The demand for workers in these jobs depends significantly on orders from manufacturers. Employment in manufacturing is projected to rise at one-half the rate of employment in all industries during the 1984–95 period. Some rapid growth firms in high-tech fields may favor using temporaries because demand for their products can change very quickly. The long-term prospects in manufacturing probably are not favorable, however, because industrial workers generally have the kinds of jobs most susceptible to laborsaving technology. Increases in the demand for industrial temporary workers are expected to come mostly from other sectors of the economy, such as construction and wholesale and retail trade.

Future increases in the demand for temporary workers in medical fields are expected to be concentrated in nursing homes and private residences. The growing number of elderly and disabled persons in need of long-term care is rising rapidly, which is increasing the demand for nurses in these settings. In addition, to hold down costs, hospitals are discharging patients as soon as possible, which means that more people will be recovering from surgery, stroke, or other major disabilities in nursing homes or their own homes. Many of them will need intravenous therapy, respirator support, and other equipment that requires the supervision of registered nurses. Changes in private insurance and Medicare coverage are making home health care more affordable for patients recovering from acute illnesses. Much of the increase in demand for temporary medical personnel will occur in home health care, because these jobs by their nature tend to be less continuous than those in hospitals and nursing homes. Some temporary help firms have developed comprehensive programs for delivering a package of services to the home patient, including periodic visits by a registered nurse and basic care by licensed practical nurses and nurses' aides. Competition from visiting nurses associations (classified in SIC 8091), nurses registries (classified in SIC 7361), and other industries that provide home health care services, however, may limit growth for the temporary help industry in this market. Expansion also may be limited by a lack of employees who are willing to work in the evening, at night, and on weekends.[10] The outlook in hospitals is not clear. Cost containment efforts probably are greatly reducing overstaffing as a way of handling variations in workloads, thus making hospitals more dependent on temporary nurses when needs suddenly rise. Many large hospitals, however, may prefer to operate their own temporary nurse pools. □

FOOTNOTES

[1] Wage and salary employment levels for 1978 through 1981 were obtained from State reports of establishments covered under State unemployment insurance laws. These reports cover about 98 percent of total civilian wage and salary employees on nonagricultural payrolls in the United States. Estimates of wage and salary employment for 1982–85 were obtained from the Bureau of Labor Statistics' Current Employment Statistics (CES) program, which provides information from payroll records of employees based on a sample survey of establishments. Employment data from these two sources are basically comparable. In fact, the State reports of establishments covered under unemployment insurance laws are the primary sources of benchmark information for the Current Employment Statistics program. A description of the two sources appears in the monthly Bureau of Labor Statistics publication, *Employment and Earnings*.

[2] Many businesses besides those in the temporary help supply industry provide personnel to other organizations on a contract or fee basis. Included among these are employee leasing firms (SIC 7369) which supply all the workers needed by an organization, and companies that provide a special service such as managerial (SIC 7392), janitorial (SIC 7349), or guard (SIC 7393). Jobs with these firms, however, generally are not temporary. Also, workers usually are supervised by the supplying firm instead of the customer, except in the case of employee leasing.

[4] Employment Cost Index–December 1985, BLS News Release, January 28, 1985. The trend of larger increases in benefits than wages reversed in 1985, when wages were up 4.4 percent, compared with 4.3 percent for total compensation.

[5] Estimates for the four markets are based on the following occupational

categories from the Bureau's industry-occupation matrix for the personnel supply services industry. *Office:* administrative support occupations, including clerical; managerial and management related occupations; marketing and sales occupations; lawyers; teachers, librarians, and counselors; legal assistants and technicians. *Industrial:* helpers, laborers, and material movers; transportation and material moving machine and vehicle operators; precision production, craft, and repair occupations; machine operators, assemblers, and inspectors; agriculture related occupations; service occupations (except health service and related occupations). *Medical:* health diagnosing and treating occupations; health technicians and technologists; health service and related occupations. *Engineering and technical:* engineers, architects, and surveyors; natural, computer, and mathematical scientists; social scientists; writers and artists; technician occupations (except health technicians and technologists, and legal assistants and technicians).

[6] Establishments that supply engineers and other nonmedical technical personnel to customers for temporary assignments are called job shops. Analysis of available information indicates a lack of consistency in the industry classification of job shops. While some of these establishments are classified in the temporary help supply industry (SIC 7362), the bulk of them appear to be classified in the engineering, architectural, and surveying services industry (SIC 8911). Many officials of job shop firms prefer classification under SIC 8911 because they associate SIC 7362 with clerical occupations. Data on the number of workers supplied by job shops are not available, but some industry observers estimate that it may have been as high as 150,000 in 1985.

'Union avoidance:' management's new industrial relations strategy

JOHN CHALYKOFF AND PETER CAPPELLI

As industrial relations in the United States continue to experience rapid change even as the economy improves, it is becoming clear that market pressures are not the only forces driving these changes. In particular, the growing variance in labor practices within industries suggests the need to look not only at pressures from the environment, but also at the different strategies and tactics introduced by the parties at the firm level. Many argue that the most important of these currently operate from the management side.

The most important of management strategies may be the decision to try to avoid unions altogether. One of the more controversial of such efforts is the use of aggressive campaigns in representational elections. These often include management unfair labor practices which, as Paul Weiler pointed out in 1983, have increased fivefold since the 1950's.[1] The upward trend in management unfair labor practices parallels quite closely the decline in public support for unions over this period.[2]

In many ways, the more desirable strategy for management would be to avoid representational campaigns altogether. What such strategies have in common is an effort to move production away from current areas of union strength which may make it possible to avoid dealing with unions at all.[3]

Explaining union avoidance

What factors cause firms to pursue strategies which lead to the avoidance of unions? A unique survey of management industrial relations practices conducted by The Conference Board in 1977 and 1983 may help answer that question. The survey asked about a range of organizational characteristics, labor relations practices, and bargaining outcomes in unionized firms. It also asked directly about the priority given to "union avoidance" strategies; is it a higher priority than achieving favorable outcomes in collective bargaining ("best bargain" strategies)?[4] The following tabulation shows the breakdown of responses for the 228 unionized firms answering in both 1977 and 1983:

	Same strategy in 1978 and 1983		*Switched strategy in 1983*	
	Percent	*Number*	*Percent*	*Number*
Union avoidance strategies	25	56	20	46
Best bargain strategies	49	111	6	15

As one might expect, the priority shifts toward union avoidance in 1983. Looking at those firms whose positions were consistent in both years (56 union avoidance firms, 111 best bargain firms), several factors seem to explain their decision. One factor concerns the ability of unions to counter union avoidance strategies. The United Auto Workers, for example, got General Motors to agree to be neutral in representational campaigns in its southern plants, and recently secured agreements to limit subcontracting; airline and trucking unions have secured restrictions on double-breasted operations.

The statistical association between three variables—percent of a firm's work force organized, plant-by-plant bargaining structure, and number of new establishments opened since 1975—and the priority attached to union avoidance for firms whose strategy was the same in 1978 and 1983 suggests that the association is strong, especially with the percent of the firm's work force organized. The first two variables help measure the ability of unions to counter such strategies, while the last variable measures the opportunity for firms to pursue these strategies. A separate

The title of their full IRRA paper is "The Effects of Management Industrial Relations Strategy: Results of a Recent Survey."

discriminant function analysis finds that these three variables correctly classify 91 percent of the union avoidance firms and 88 percent of the best bargain firms.[5]

Consequence of union avoidance

Perhaps the most important and most obvious consequence of a union avoidance strategy is its effect on union membership and growth within unionized firms. Overall, unionization in union avoidance firms dropped, on average, from 23.5 percent in 1977 to 18.6 in 1983, compared with 63.5 to 60.5 percent for best bargain firms over the same period.[6] Because union coverage was substantially lower in the former to begin with, its decline in percentage terms is much more substantial; a 20.8-percent decline in coverage for union avoidance firms, compared with a 5-percent decline for best bargain firms.

Some indication of how this decline came about is suggested by the data in the following tabulation:

	Union avoidance firms	*Best bargain firms*
Average number of representational elections held in last 5 years	4.03	2.22
Proportion of representational elections won by union in last 5 years	.177	.379
Average number of new plants opened since 1975	4.51	1.97
Proportion of new plants organized	.076	.439

As measured by plant openings, the union avoidance firms—which are less unionized—appear to be growing about twice as fast as the best bargain firms. Most importantly, union election victories occur half as often in union avoidance firms as in best bargain firms. It is perhaps surprising, therefore, that unions do not appear to be concentrating their organizing efforts at the best bargain firms. The ratio of elections to plant openings is about the same for both sets of firms.[7] This suggests, if anything, that more union resources are directed at the union avoidance firms, as one would imagine that it is more difficult and costly to secure elections in them.

Overall, new plants at best bargain firms are almost six times more likely to be organized than their counterparts at union avoidance firms.[8] This difference seems very large given that the overall union win rate is only twice as great in the former—especially if we assume that the ratio of elections to new plants is roughly similar for firms in both groups.[9] The explanation could be that union avoidance firms run election campaigns that are much more successful in their new plants than in their old ones. While this may play some role, it seems more likely that the great difference in organization rates at new plants is due to the greater ability of union avoidance firms to keep representational campaigns away from their new plants.

Differences in collective bargaining outcomes are also associated with the union avoidance priority. For example, the survey results suggest that union avoidance firms pay lower wages to their union employees, other things being equal. Even though best bargaining firms are concentrating their efforts on collective bargaining, the lower union coverage of avoidance firms appears to give them greater bargaining power vis-a-vis their unions and leads to lower settlements.[10] ☐

[1] Paul Weiler, "Promises to Keep: Securing Workers' Rights to Self-Organize under the NLRB," *Harvard Law Review*, June 1983, p. 1769.

[2] The first sharp increase occurs in the late 1950's when union corruption came to the public's attention, culminating in the McClellan hearings and the Landrum-Griffin Act. The next sharp increase occurred in the early 1970's when any macroeconomic justification for unions was eroding.

[3] Thomas A. Kochan, Robert B. McKersie, and Peter Cappelli, "Strategic Choice and Industrial Relations Theory," *Industrial Relations*, Winter 1984, pp. 16–39. The authors argue that these strategic decisions which help shape union-management relations take place outside of collective bargaining; the most important appear to be management decisions at the corporate level.

[4] The question asked, "Which is more important to your firm, keeping as much of the company as possible nonunion or achieving the most favorable bargain possible?" It is not asking which situation the company would prefer. We recognize the possibility that a firm's reply may simply be a proxy for existing practices rather than an independent statement of policy that will influence labor relations decisions. Our purposes are served, however, as long as it is an accurate proxy for those decisions. For a description of the survey and the overall conclusions, see Audrey Freedman, "The New Look in Wage Policy and Employment Relations," Report 865 (New York, The Conference Board, 1985). Thomas A. Kochan, Robert B. McKersie, and John Chalykoff investigate some of the survey's important results in detail in "Corporate Strategy, Workplace Innovations, and Union Members," *Industrial and Labor Relations Review*, forthcoming.

[5] Those firms which switched to a union avoidance strategy in 1983 also had significantly lower union coverage and less centralized bargaining structures than best bargain firms, perhaps suggesting that these variables also influence the ability of firms to switch to a union avoidance strategy.

[6] We recognize the possibility that independent factors associated statistically with this choice of strategy could be behind these results. Attempts to find statistical associations between the choice of strategy and potential sources of influence other than those discussed earlier, such as the nature of the industry, proved insignificant.

[7] Of course, established plants can also be targets for organizing. The assumption here is simply that union campaigns are directed at new plants in roughly the same proportion for both union avoidance and best bargain firms.

[8] Firms that switched to union avoidance strategies also won more elections and had fewer new plants organized than did best bargain firms.

[9] If the proportion of elections held at new plants was in fact the same for both union avoidance and best bargain firms, the latter would be only 2½ times likely to be organized, given win rates.

[10] The regression results supporting this conclusion are available upon request. See John Chalykoff, "Industrial Relations at the Strategic Level: Indicators and Outcomes," *MIT Working Papers*, October 1985, for other outcomes associated with this variable.

Environmental factors in the labor-management relationship

PAULA B. VOOS

In recent years, there has been an explosion of interest in cooperative labor relations. Employee participation programs, gain-sharing programs, and joint union-management committees of various types have all received considerable scrutiny. However, while there has been discussion of the economic circumstances which lead the parties to experiment with such programs, there has been less consideration of the extent to which the collective bargaining environment is itself separately and systematically related to the type of labor relations that emerge.

This is surprising insofar as the influence of economic and organizational factors on labor-management relations was discussed at length by an earlier generation of industrial relations scholars and practitioners. On the basis of numerous case studies, the earlier scholarship concluded that the environment was extremely influential and probably set the limits of union-management cooperation in any particular firm. If the environmental factors are very influential, they may seriously constrain the success of programs to improve labor relations.

This analysis explores the impact of certain environmental variables on the overall labor relations climate of the firm as it is perceived by management. The variables were selected after careful review of the earlier literature. Hypotheses concerning each variable were tested using a multiple regression equation context and cross-sectional data gathered by the author.[1]

Study scope and method

The data used in the study are from an anonymous mail questionnaire sent to a 624-member sample of managers of unionized Wisconsin firms in autumn of 1984. In addition to questions on key firm characteristics, managers were asked to categorize the overall relationship existing between their company and the union representing their employees as (1) exceptionally good, (2) very good, (3) fairly good, (4) neither good nor poor, (5) fairly poor, (6) very poor, or (7) exceptionally poor.[2]

Usable questionnaires were returned by 339 managers. While there is always some self-selection in survey data, more than 50 percent of the managers in the initial sample produced the assessment of their firm's labor relations which is used in this research. Consequently, these data provide a reasonable basis for the test of a number of hypotheses about the impact of the environment on labor relations, at least insofar as the overall union-management climate is perceived accurately by managers.

Because the managerial assessments of the overall union-management relationship were categorical, a simple probit model was adopted in the initial analysis. The coefficients produced by maximum likelihood estimation of such a probit model can be interpreted as measuring the impact of each economic or organizational variable on the probability that the firm will be perceived by the responding manager to have good or better labor management relations. The hypotheses about the important environmental variables were generated from an examination of the earlier literature. Specifically, it was hypothesized that good labor-management relationships are more probable where:

- Companies are of moderate size.
- The union-management relationship is of longer duration.
- The company is located in a metropolitan area.[3]
- There have not been major changes in production technology, skill requirements, or product produced in the 4 years prior to the survey.
- The economic position of the firm is secure as indicated by the trend in company profits over the 1980–84 period.
- Industry bargaining patterns are stable, that is, there has been no major change in the bargaining pattern in the industry in the prior 4 years.
- Management is stable and secure as indicated by the absence of a major change in company management or ownership in the preceding 4 years.
- The local union is stable and secure, as measured on two variables: 1) no major change in local union officers had occurred in the past 4 years, and 2) there had been no other organizational instability on the union side, including internal political turmoil in the union, a recent unsuccessful decertification attempt, or an unsuccessful attempt to change the union representing employees.[4]

Along with the above hypotheses, an additional contemporary factor was examined: management's strategy in recent collective bargaining negotiations. The hypothesis was that concession demands can be a source of disruption in overall union-management relationships. Two variables were entered to gauge the effects when management had sought 1) major concessions with regard to wages, health benefits, COLA clauses, or work rules in the most recent negotiations, or 2) minor concessions in these same items.

Results of the estimation

While several of the hypotheses were substantiated by the estimated probit equations, others failed to receive support at conventional levels of significance. As predicted, organizations moderate to large in size were more likely to have good labor relations than either small or very large firms. The probability of good relations increased up to unit sizes

Paula B. Voos is an assistant professor of economics and industrial relations at the University of Wisconsin, Madison. The title of her full IRRA paper is "Cooperative Labor Relations and the Collective Bargaining Environment." Financial support for this research was provided by the Graduate School, University of Wisconsin, Madison.

of between 1,700 to 1,900 employees and decreased thereafter.

Moreover, good relationships were significantly less likely if the union involved had represented employees for less than 4 years. New labor-management relationships were less smooth, as expected. However, relationships that had lasted more than 20 years were neither better nor worse than moderately old (4- to 20-year) relationships. The estimates also indicate that firms located in the urban area of Milwaukee had better labor-management relations than firms located in the smaller cities and towns of Wisconsin. It would be interesting to learn if this is also the case in other States.

On the other hand, most of the variables measuring recent economic and organizational stresses on the union-management relationship failed to be significantly related to the probability that a good union-management relationship was present. As anticipated, major changes in industry bargaining patterns, company ownership, or management, and turnover of local union officials carried negative coefficients, but these coefficients were not significant. Only other organizational instability in the union, a variable measuring internal political turmoil or union insecurity in the collective bargaining relationship itself, carried a significant coefficient. Thus, this study does provide support for the view that union leaders must be secure if they are to pursue cooperative labor relations. Either political strife within the union or an insecure relationship with management can lessen the probability of good relations.

Finally, changing technology, skill requirements, or product, and major decreases in company profits actually had positive, albeit insignificant, impacts on labor relations. Similar positive results were also obtained for the variables measuring increases in foreign and domestic competition, contrary to the hypotheses. It appears that economic pressure on the firm can be accompanied by either good or poor union-management relations; the point estimates from this study were all in accord with the view that relations are better in companies under more economic pressure, on average, but the insignificance of the coefficients indicated that this is not a reliable conclusion.

It is also interesting to note, given the recent increase in concession bargaining, that management demands for concessions did not necessarily worsen overall relations; the coefficients on both variables designed to test the hypothesis were negative but insignificant. □

FOOTNOTES

[1] It is recognized that this statistical approach is a departure from the case study methodology which has long characterized this area of research. The goal is not to supplant that methodology, but to complement it by determining whether or not certain economic and organizational factors are statistically related to the type of labor relations existing in a large number of firms.

[2] The proportion of employers responding in each category: Exceptionally good, .110; very good, .384; fairly good, .393; neither good nor poor, .082; fairly poor, .021; very poor, .003; exceptionally poor, .006.

[3] The converse hypothesis that location in very large, conflict-laden metropolitan areas decreases the probability of good relationships is not explored because there are no such areas in the State of Wisconsin. In the early 1980's, Milwaukee had a population of about 1 million.

[4] It is recognized that this is a diverse list of factors. They were aggregated because some of them were too infrequent to be entered separately into the regression analysis.

Canadian unions achieve strong gains in membership

MORLEY GUNDERSON AND NOAH M. MELTZ

In sharp contrast to the situation in the United States, union membership has not declined in Canada. In fact, union membership has grown from 2.7 million in 1974 to 3.6 million in 1982, remaining at that level through 1984 and accounting for approximately 40 percent of the nonagricultural paid workforce. Much of the growth since the 1960's has occurred in the public sector, which is heavily unionized; however, unionism has been sustained or has grown across many elements of the private sector. While union membership has been maintained, organized workers have been challenged by the increased use of nonunion labor, especially in construction.

Canadian unionism has become more national than international in scope. That is, there appears to be a pronounced and steady trend away from International (that is, U.S.)-based unionism. The international proportion of total Canadian membership fell from 53.2 percent in 1975 to 39.4 percent in 1985. This reduced share did not result from a decline in international union membership. In fact, the number in 1985 was almost identical with that in 1974. The relative decline of international unions came from the addition of almost 1 million members in national (Canadian-only) unions. A large part of this growth was due to public sector unions which have grown since the 1960's to replace the blue-collar unions as the largest unions in Canada. In addition, some formerly international unions became national unions. The largest single change is the recent formation of the UAW–Canada. This move involves 136,000 members and would lower the proportion of international membership in 1985 from 39.4 percent to 35.7 percent.

The shift from international to national unions was a relatively limited phenomenon prior to the UAW-Canada. A more pronounced development was the increase in autonomy among the Canadian sections of international unions. At the time of this writing, the UAW-Canada is being closely observed to see whether it will set a pattern for other inter-

nationals. The president of the union, Robert White, who is in large part responsible for the formation of the new union, advocates merger with a number of other unions, such as the Steelworkers, to form a large metalworkers federation. The United Steelworkers of America, under its Canadian-born President Lynn Williams, is strongly resisting this development.

A final point concerning international unions relates to the Canadian Federation of Labour, an organization formed in 1982 of international unions in the building trades. These unions left the Canadian Labour Congress following a jurisdictional dispute with construction unions being certified by the Quebec provincial affiliate of the CLC. To date, there has not been a major move by the CLC to establish rival construction unions outside of Quebec.

Changes in legislation

The legal subsystem has been identified as an important factor in the growth of union membership in Canada.[1] In the case of Canada, the responsibility for labor relations rests with the provinces. Fewer than 10 percent of workers are covered by Federal legislation. Prior to the period of time under consideration, three jurisdictions granted their public employees the right to organize and strike: Saskatchewan in 1944; Quebec in 1964; and the Federal government in 1967. In 1973, four more provinces passed similar legislation. In 1975, schoolteachers in Ontario were given the right to strike; in fact, full-time teachers were required to belong to one of the various teachers' associations.

Other legislation has also provided protection for unions, including the anti-strikebreaking law in Quebec and the anti-professional strikebreakers law in Ontario. Several jurisdictions have introduced provisions to provide for the arbitration of first agreements when there is an element of bad-faith bargaining (British Columbia, Manitoba, Quebec, and the Federal jurisdiction). British Columbia, Saskatchewan, Manitoba, Ontario, and Quebec provide for the imposition of compulsory dues checkoff for union members and nonunion workers. A boost for unions was also given by the provision in all labor codes (except Nova Scotia) for certification without a representation vote if a majority of the bargaining unit are members of the union. This is in sharp contrast to the United States, where a certification election is required after the union application for certification.

Strong enforcement of labor legislation has also tended to favor unions. Two cases, in which unfair practices by companies resulted in large monetary settlements and changes in legislation, were seen as a warning to companies which might be tempted to violate the legislation. This again is in sharp contrast to the United States, where the National Labor Relations Board has been reluctant to apply remedial measures against employers who violate the requirement to bargain in good faith, thereby leading to fewer certifications and fewer negotiations of a first contract.[2] □

Research Summaries

Distribution of consumption examined using aggregate expenditure shares

KIRK KANEER

What proportion of aggregate expenditures for food in the U.S. economy is made by lower income groups, and what proportion by the highest? How much of total fuel and utilities is purchased by urban residents of the Northeast region? The answers to these and similar questions about the distribution of consumption among diverse population groups can have important implications for social and economic policy or for organizational marketing strategies.

This report presents estimates of aggregate expenditure shares,[1] developed from the Bureau's ongoing Consumer Expenditure Survey, that can help to clarify such issues. It is one of a series of reports which focuses on alternative ways of examining the expenditure survey data and presenting previously unpublished results.

'Expenditure share' defined

Mathematically, an aggregate expenditure share (s_i) is defined as:

$$(\overline{X}_{ij})(f_j)/(\overline{X}_i)(N)$$

where $\overline{X}_{ij}$ is the average expenditure of population group j for item i; f_j is the number of consumer units in group j; $\overline{X}_i$ is the "all consumer units" average expenditure for item i; and N is the number of consumer units in the total population. For purposes of the expenditure survey, a consumer unit is defined as a group of persons living together who pool their income to make joint expenditure decisions, such as a family or independent single people.[2] Each consumer unit has a householder or "reference" person; this person is the first member mentioned by the survey respondent when asked to list the members of the unit starting "with the name of the person or one of the persons who owns or rents the home." It is with respect to this person that consumer units are classified.

Some examples based on actual expenditure survey data serve to illustrate the calculation and proper interpretation of aggregate expenditure shares. Suppose one wants to determine how much of the aggregate expenditure for food was made by consumer units with householders age 65 or over in 1982–83. Based on survey data, there were 13.8 million such consumer units in that period, and their mean annual food expenditures were $2,288. The aggregate expenditure for food by this group was $31.6 billion (13.8 million times $2,288). There were 71.6 million consumer units in the urban population[3] with a mean food expenditure of $3,137; thus, the aggregate food expenditure for all consumer units was $224.6 billion. The aggregate expenditure share for food purchased by consumer units in the 65-and-over age group was 14.1 percent ($31.6 billion/$224.6 billion), while their population share was 19.3 percent (13.8 million/71.6 million).

Two factors influence a group's aggregate expenditure share: 1) the group's mean expenditure for the item, and 2) the number of consumer units in the group. Two groups could have the same aggregate expenditure share but for different reasons. For example, the under-25 and the 65-and-over age groups had about the same aggregate expenditure shares for entertainment in 1982–83, although the group under 25 spent one and a half times as much per consumer unit as those in the older group. However, the younger group had only about half as many units as the 65-and-over group, and thus the total dollars spent by each group were almost equal.

Aggregate expenditure shares are to be distinguished from shares of each consumer unit's budget spent for various expenditure items (budget shares). A given group could spend a large proportion of their total expenditures for a particular item, and yet have a relatively lower aggregate expenditure share. A case in point is the transportation expenditures of the under-25 age group. Their mean transportation expenditure of $2,623 per consumer unit in 1982–83 was 22.6 percent of their total annual expenditures. Yet their share of aggregate transportation expenditures was only 6.9 percent because their mean transportation expenditure was below the all-consumer-unit average.

Highlights

Aggregate expenditure shares from the interview portion of the 1982–83 expenditure survey (see "Notes on the data")

Chart 1. Distribution of consumer units, and aggregate expenditure shares for health care, by age of householder, 1982-83

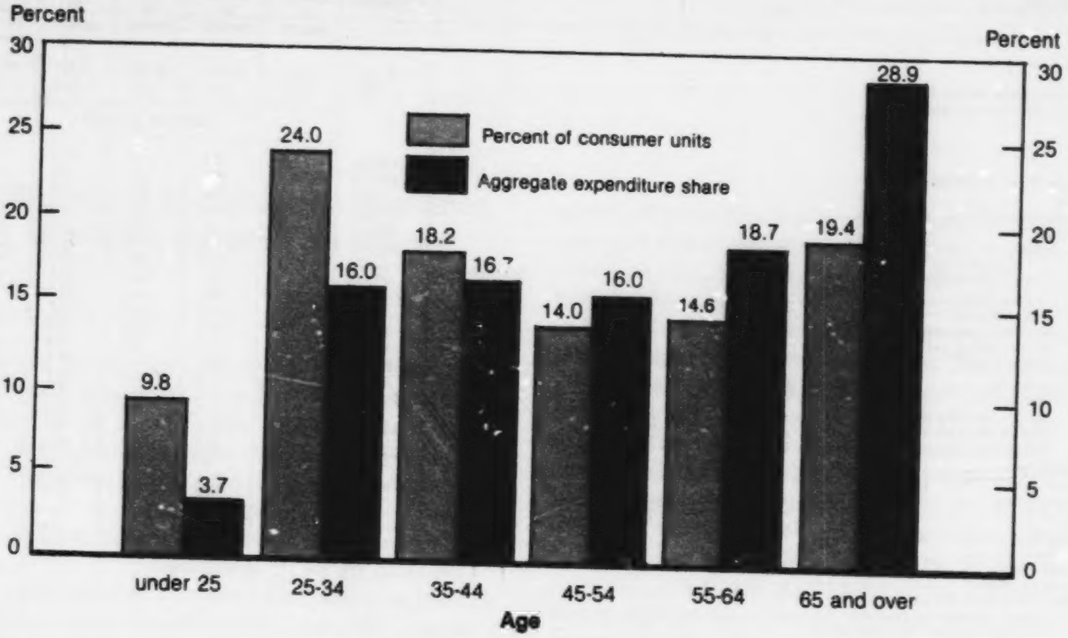

Chart 2. Distribution of consumer units, and aggregate expenditure shares for fuels, utilities, and public services, by region, 1982-83

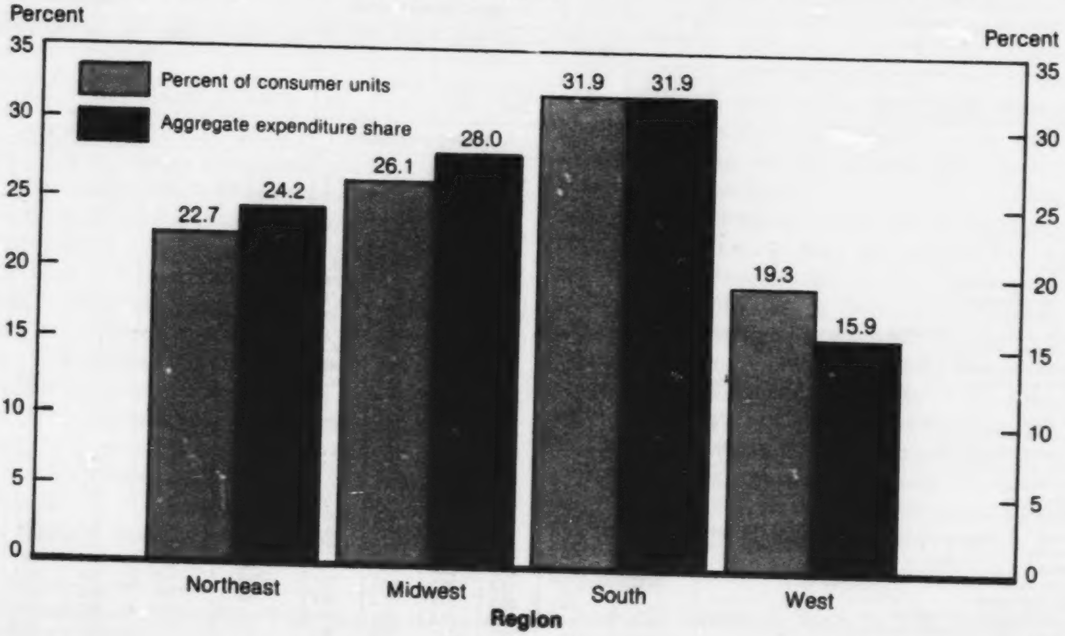


are presented in tables 1 and 2. Consumer units are classified by income quintile,[4] age of householder, and region. Among the salient findings:

- The lowest income quintile group accounted for 9 percent of total aggregate expenditures, less than half of the proportion of the population they represent. The highest income quintile's aggregate expenditure share for all items was 37 percent, which was almost twice their 20-percent proportion of the population.
- For the lowest quintile, which includes many student consumer units, the only items for which aggregate expenditure share approximated population share were rent and education.
- The aggregate food expenditure shares for the 25-to-34 and 35-to-44 age groups were nearly the same—23 percent and 24 percent, respectively—but the mean annual food expenditure of the older group was more than $1,000 higher.
- More than a third of aggregate expenditures for rented dwellings were made by consumer units in the 25-to-34 age group.
- The group age 45 to 54 had the largest aggregate expenditure share for education, 30 percent, because many in this group are likely to be paying for children's college education.
- The group under age 25 had the lowest aggregate expenditure share for transportation, while the group 25 to 34 had the largest. It is between these age groups that vehicle ownership increased from 70 percent to 87 percent.
- As expected, the 65-and-over group had the largest aggregate expenditure share for health care. (See chart 1.)
- While the aggregate expenditure shares for the regions were generally about the same as their population shares, there were some noteworthy differences. For example, the West's aggregate expenditure share for rented dwellings was 9 percentage points above its population share.
- The West's aggregate expenditure share for fuels, utilities, and public services was 3 percentage points below its population share. This is because the West has a large proportion of renters whose rent payment includes utilities. (See chart 2.)
- Aggregate expenditure shares for public transportation were 7 percentage points above the population share in the West and 8 percentage points below the population share for the South. (Public transportation includes airfares as well as mass transit.)
- The aggregate expenditure share for education in the Northeast was 7 percentage points above the population share, while the South's was 6 percentage points below. The Northeast had the largest proportion of student consumer units.

Notes on the data

Data for the Consumer Expenditure Survey are collected from a nationwide sample of households in the civilian noninstitutional population. The survey is conducted for the Bureau of Labor Statistics by the Bureau of the Census.

The continuing survey represents a major enhancement of a long-established program. The Bureau of Labor Statistics has been gathering information on spending patterns and living costs for nearly a century—since the Federal Government authorized such a survey in 1888–89. For the past half century, the survey has been part of the periodic revision of the Consumer Price Index, next slated for 1987.

The current survey incorporates major methodological improvements that were first used in the 1972–73 survey.

About 5,000 households in each of two independent samples are asked to participate in the survey. Households in one sample are asked to participate in a quarterly interview survey over a 12-month period. (Twenty percent of the sample for the interview survey is replaced each quarter.) The other sample is asked to keep a detailed record of expenses in the form of a diary for 2 consecutive weeks.

The expenditure data should be interpreted with care. The expenditures are averages for a sample of households in the group being analyzed, and as such are subject to both sampling and nonsampling errors. ☐

FOOTNOTES

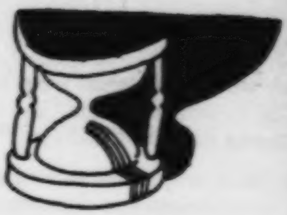
[1] Sometimes referred to as market shares.

[2] See U.S. Department of Labor, *Consumer Expenditure Survey: Interview Survey, 1982–83*, Bulletin 2246 (Bureau of Labor Statistics, February 1986).

[3] The urban population consists of all persons living in Standard Metropolitan Statistical Areas (SMSA's), and in urbanized areas and urban places of 2,500 or more persons outside of SMSA's. "Urban," as defined for this survey, includes the rural populations within SMSA's.

[4] Consumer units are ranked in ascending order of income, and then divided into five equal groups.

Major Agreements Expiring Next Month



This list of selected collective bargaining agreements expiring in May is based on information from the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more. Private industry is arranged in order of Standard Industrial Classification.

Employer and location	Private industry	Labor organization[1]	Number of workers
Homestake Mining Co. (Lead, SD)	Mining	Steelworkers	1,300
Building Trades Employers Association of Westchester and Putnam Counties, N.Y., Inc. (New York)	Construction	Carpenters	1,800
Master Builders Association (Pennsylvania)	Construction	Carpenters	5,000

Developments in Industrial Relations

Meat processing contracts

Recent developments in the meat processing industry centered on the continuing and increasingly bitter strike against Hormel's Austin, MN, plant, but there were more encouraging events elsewhere in the industry, as other United Food and Commercial Workers locals negotiated new agreements.

In Sioux Falls, SD, 2,500 members of the United Food and Commercial Workers Local 304A employed by John Morrell Co. will receive $1 an hour in wage increases over a 3-year contract term, bringing the base or common labor pay rate to $9.75. This was short of the union's $10 an hour goal for its members throughout the industry, but the union still considered it a dramatic rise in view of the company's initial demand for a cut, which was a factor in the 3-month strike that preceded the settlement.

Until 1983, the base rate in the meat processing industry was generally $10.69 an hour for United Food and Commercial Workers. Since then, intensified competition from lower cost nonunion companies, changes in processing and distribution methods, and cuts in consumption of red meat hurt many firms and forced the union to accept a lower pay rate of about $8.25. Following this concession, the union set a goal of restoring the rate to about $10 over the next few years, and has been successful in some recent settlements.

Other terms at Morrell included reduced pay rates for new hires, termination of the profit-sharing plan (the workers were guaranteed a $500 payment in December 1985), and a change in the pension plan permitting workers with 30 years of service to retire at any age (formerly, age 55).

Unlike Morrell, which has been operating at a profit and could guarantee its wage increases, Wilson Foods Corp. has lost money in each of the past 5 years, so the union agreed to a 3-year contract that provides for movement towards the $10 goal to be contingent on profitability. Under the provision, the 2,800 workers will receive annual lump-sum payments ranging from 10 cents per compensated hour if the pretax profit for the year is $2-$4 million, up to 25 cents if the profit is $8 million or more. Unlike most profit-sharing plans, Wilson's calls for the hourly amount used to calculate the lump sum to be incorporated into hourly pay rates after each annual payment and to be paid in subsequent regular weekly paychecks.

In other provisions, the union will be permitted to appoint one person (not an officer or member of the union) to Wilson's board of directors, the company will provide the union with annual certified audits of its finances, and the company president will meet quarterly with union officers to discuss finances and operating strategies that could affect employees at the plants, located in Monmouth, IL, Logansport, IN, Oklahoma City, OK, and Cherokee and Clarinda, IA.

The contract also requires Wilson to give 6 months' notice of plant closings and to guarantee employee work or pay for 1 year after the end of the notice period; continue health insurance for 6 months for employees terminated by the closing of a plant department or larger unit; and provide job relocation assistance and retraining for laid-off employees.

Profit-sharing was a feature of a new contract the United Food and Commercial Workers negotiated with Farmstead Foods plants in Cedar Rapids, IA, and Albert Lea, MN. A company official said that other terms were similar to those at Wilson, which had owned the two plants until 1985, when Wilson sold them to aid its financial condition.

At Farmstead, the profit-sharing rate will range from 10 cents if the annual profit is $1.61–$3.2 million to 25 cents if profits exceed $8.1 million. As at Wilson, an amount equal to the cents per compensated hour will be incorporated into hourly pay rates after each profit-sharing distribution. In a difference from Wilson, the 2,700 Farmstead employees will also receive annual supplemental profit-sharing distributions calculated at 5 to 12.5 cents per hour, depending on the amount by which possible annual profits exceed $3.21 million. The calculation rate for these supplemental distributions will not be incorporated into hourly pay rates.

In addition to job security provisions similar to those at Wilson, the Farmstead contract requires the company to give the union 45 days' notice of any possible sales of assets affecting the jobs of employees in the bargaining unit. The company also stated its "strong desire and objective" that any possible purchasers of the plants retain current employees, assume the current labor agreement, and recog-

"Developments in Industrial Relations" is prepared by George Ruben of the Division of Developments in Labor-Management Relations, Bureau of Labor Statistics, and is largely based on information from secondary sources.

nize the United Food and Commercial Workers as bargaining agent for the workers.

Elsewhere in the industry, members of United Food and Commercial Workers Local 405 in Goodlettsville, TN, approved a 3-year contract with Oscar Mayer & Co., ending a 4-month strike.

The base rate for production workers was reduced to $10 an hour (from $10.69) matching the level negotiated with other pork processors in 1985. In December 1986, the 575 employees will receive a 25-cent wage increase, which will keep the company at "the high end of the scale for the industry," according to a company representative.

There were reductions in several benefits. Pensions will now be calculated at $17.50 a month for each year of service prior to October 1, 1985. That rate will be reduced to $12 for each year of service during the October 1, 1985-December 31, 1986 period, and then will rise to a $13 rate for later service. Paid vacations also were cut for new employees.

United Steelworkers set bargaining goals

The United Steelworkers are preparing for a heavy round of 1986 bargaining by formulating general goals for the steel, aluminum, metal container, and nonferrous metals industries. The union's Wage Policy Committee said, "the issue of overriding concern to our members must be the safeguarding of employment opportunities, in view of the loss of nearly 500,000 jobs in the industries since 1979."

Specifically, the Committee said bargainers will press for bans on the contracting out of work that can be performed by the union's members and on employers shifting work to their nonunion facilities. Along the same lines, the union also said it will press for more stringent provisions for advance notice and consultation on proposed plant closings.

The union also moved to thwart widespread employer attempts to negotiate concessionary settlements, but admitted that there are "specific situations where the consequences to our members of not accepting concessions are far worse than the consequences of accepting them." Where concessions are necessary, the union said, they must be balanced by assurances that the workers are the beneficiaries rather than the victims of efforts to save a company. Much of this concern was triggered by the 1985 concessionary settlement with Wheeling-Pittsburgh Steel Corp., which gave the union a voice in the plan to save the company, but also led other producers to say that they would seek similar concessions in 1986 to maintain cost parity with Wheeling-Pittsburgh. Other union goals for the four industries include:

- Union surveillance of pension fund investments to prevent the funds from being used for leveraged buyouts of companies.
- Labor-management programs to contain health care cost increases without shifting any of the companies' premium cost to the employees.
- An overhaul of grievance procedures to reduce delays and to penalize employers who repeatedly violate contract provisions.
- Union representatives on company boards "in appropriate circumstances."
- Restrictions on searches, surveillance, and lie-detector tests.

Steelworkers officials from around the Nation have met to decide specific bargaining tactics to be used in the negotiations with steel producers. This meeting was particularly important in this bargaining round because of the end to the 30-year old unified approach to bargaining announced by the companies in 1985. Although the union will now negotiate with the companies individually, indications are that the Steelworkers will attempt to maintain the wage and benefit uniformity that had developed over the years.

In a move to adapt to the new bargaining approach, employees at each company will vote on their proposed agreements. Previously, the 550 local union officers had the sole right to vote on the terms.

Because of the uncertainties of the new bargaining approach, both union and management indicated a desire to start negotiations earlier than in the past, and talks were underway in February at most major companies, where current contracts expire on July 31.

At financially troubled LTV Steel Co., the union agreed to defer until April the final stage of restoration of the temporary pay and benefit cuts workers at its various companies had accepted in 1983 to aid the industry. (Wage restoration was completed in February at the other companies.) In return for the further 3-month delay in restoration, LTV Steel agreed not to implement a scheduled cut in its financing of Supplemental Unemployment Benefits, gave up the right to seek a cut in pensions in the continuing negotiations on a new contract, and agreed not to use nonunion contractors without prior union approval. LTV lost $176 million on operations in the first 9 months of 1985, and wrote off $380 million for closing its large plant in Aliquippa, PA.

Bethlehem Steel Corp. and National Steel Corp. also sought restoration deferrals similar to those at LTV Steel, but the union turned them down, apparently because it did not consider their financial situation to be as critical as that at LTV.

In the copper industry, a coalition of 13 unions headed by the Steelworkers rejected pay cut proposals of the two largest companies. Kennecott Copper Corp. proposed a 4-year contract calling for a one-third cut in compensation, and Newmont Mining Corp. proposed a $6 cut in hourly pay and adoption of a two-tier system of pension and insurance benefits.

Edgar Ball, the Steelworkers' chief copper negotiator, claimed the cuts were not warranted because the companies' problems resulted from the Nation's economic and trade policies, rather than high labor costs.

Ball maintained that Phelps Dodge Corp. was operating at a profit even though compensation at its Arizona operations was $2 an hour less than that at the other companies, which were all operating at a loss. (The company's facilities in Arizona are operating on a nonunion basis after an unsuccessful strike by the unions that began in 1983, when Phelps Dodge refused to accept the industry's pattern settlement.)

Steelworkers contracts in the copper industry generally expire on June 30, 1986. The unions currently represent fewer than 10,000 copper employees, compared with 40,000 a few years ago.

Employee-owned company averts bankruptcy

Employee-owned Hyatt-Clark Industries began moving toward full output of automotive bearings after the employees agreed to concessions, including a 10- to 15-percent wage cut, a slight reduction in benefits, and changes in work assignments and output requirements. According to an official of Auto Worker's Local 736, the contract, scheduled to expire in October 1987, can be reopened earlier if company profits exceed anticipated amounts. Virtually all of the output of the Clark, NJ, plant is sold to General Motors Corp. which sold the plant to the workers in 1981 after 40 years of operation.

The concession settlement was triggered by Hyatt-Clark's inability to pay a note held by a bank. The company then filed for protection under the Federal Bankruptcy Code and a payment schedule was worked out with the bank. At the time, about 90 percent of the 1,100 union-represented workers were on layoff.

Pennsylvania Nurses Association ends strike

The longest strike against the Commonwealth of Pennsylvania since 1975 ended when nurses, pharmacists, and other health care workers represented by the Pennsylvania Nurses Association returned to work at 140 hospitals, health care centers, and prisons. At its peak, the 9-day stoppage involved about 70 percent of the 3,600 workers represented by the Association. A limited number of employees stayed on the job in critical patient-care situations, and managers temporarily filled in for other strikers.

Terms of the new contract were similar to those negotiated by other State employees in 1985. Workers will receive a 3-percent pay increase retroactive to the July 1, 1985, effective date of the 3-year contract, to be followed by additional 3-percent increases on July 1 of 1986 and 1987. According to the Association, the employees averaged $21,800 a year prior to the settlement.

The Association did not win its demand for additional "comparable worth" pay increases, but the State agreed to discussions on the issue. According to the Association, members of the bargaining unit were underpaid relative to State employees in other jobs requiring comparable education, experience, and physical requirements.

The State also agreed to delay and reconsider the downgrading of 600 psychiatric nurses, which would have prevented them from receiving merit pay increases.

Other provisions of the contract eliminated primary and election days as paid holidays and reduced paid sick leave to 13 days a year, from 15.6. For workers hired after July 1, 1985, paid personal leave was reduced to 3 days a year, from 4, and paid vacation time was reduced by 1 week through the seventh year of employment.

Building engineers in New York City settle

Building engineers at 350 New York City office buildings will receive wage increases totaling $90 a week during a 3-year contract between the Reality Advisory Board and the Operating Engineers. The first increase, $32 per week effective January 1, brought the engineers' minimum rate to $564 a week. The other increases are $28.40 on January 1, 1987, and $29.60 on January 1, 1988. For helpers, the initial increase was $25.20, bringing their minimum to $445.20, followed by increases of $22.40 and $23.20 in the second and third years. Chief engineers, mechanics, and other employees not paid according to a set wage scale received a 6-percent initial increase, followed by 5-percent increases in the second and third years.

The accord, covering 2,500 workers, also established a mandatory training program for new employees. They will start at $1.50 an hour below the current minimum helper's rate and, contingent on performance, progress to the minimum in 50-cent steps at 6-month intervals.

The agreement also provided for a 14-cent-an-hour increase (to $1.29) in the employer's financing of health benefits, a 15-cent increase (to 85 cents) in their financing of pensions, and an additional paid holiday, bringing the total to 11 per year.

Unilateral 'wage deferral' contract ruled illegal

In the trucking industry, an employer's attempt to cut costs by unilaterally imposing a wage deferral plan on its union-represented employees was rejected by the Seventh Circuit Court of Appeals. The developments leading to the decision began in 1982, when Manley Truck Lines, Inc., asked the Chicago Truck Drivers Union to incorporate a 12-percent mandatory wage deferral plan into their contract, negotiated earlier in the year. Manley contended the change was necesary to alleviate its financial problems. The union rejected the proposal, but did agree that the company could request individual employees to participate. In 1983, Manley again proposed a mandatory plan with a 15-percent withholding rate. The union again rejected this proposal and agreed that Manley could request individual employees to accept the higher wage deferral. Instead, Manley imposed the 15-percent cut (reduced to 10 percent on July 1, 1983), leading the union to file charges with the National Labor Relations Board contending that Manley's action violated the National Labor Relations Act's proscription of contract modifications without the consent of both parties.

The union's position was sustained by a NLRB administrative law judge and the Board itself, which then asked the Seventh Circuit Court to enforce its cease and desist order.

In its appeal, Manley contended that the unilateral imposition of wage deferral was necessary to avoid bankruptcy, a shutdown, and loss of jobs, which amounted to an "economic necessity" exception to Section 8(d) of the Act.

In its ruling, the Court of Appeals held that an agency such as the NLRB can interpret provisions of its authorizing statute in one of several permissible ways if the interpretation does not conflict with an expressed intent of the Congress. Concluding, the Court said "the language of 8(d) neither expressly conditions its enforcement upon the continuing economic survival of the employer's business, nor invites such a condition."

Local-negotiated accord rejected by parent union

The National Labor Relations Board upheld the Marine and Shipbuilding Worker's repudiation of a concessionary contract its Local 33 had negotiated with Bethlehem Steel Corp.'s Sparrows Point, MD, shipyard. Union President Arthur Batson said the question of regaining lost compensation for the workers was being handled by the union's attorneys and the parties' permanent umpire also could become involved.

The dispute arose in 1984 when Bethlehem asked for concessions, contending that it was losing work to other yards because its labor costs were too high. Local 33 then entered into negotiations with Bethlehem—with permission of the parent union, according to Local 33 President James Harmon, and without permission, according to Batson. The resulting agreement, negotiated 5 months in advance of the expiration of the existing agreement, called for a pay freeze through August 1987, a $2 an hour cut in pay rates for new employees, and for termination of a provision for automatic cost-of-living pay adjustments in return for adoption of a provision for possible quarterly profit-sharing distributions.

The Marine and Shipbuilding Workers union immediately moved to repudiate the accord and remove Local 33 officers from their jobs, but a Federal judge stayed the actions pending a NLRB decision. In the decision approved by the Board, an administrative law judge held that the union's constitution did not empower Batson to give Local 33 the authority to negotiate independently. Continuing, the judge said that even if the international union had somehow managed to waive the constitutional prohibition, the waiver would have had to have been "clear and unmistakable" and because it was not in writing, there was no evidence that a waiver had been granted.

Beginning in 1959, the union had negotiated national contracts with Bethlehem for as many as eight shipyards. Over the years, yards were closed, leaving only the Sparrows Point facility in 1984. Since the repudiated settlement, Sparrows Point has gained additional production contracts, but the number of employees has dropped to 1,200, from 2,200.

Coal miners end strike

A bitter and sometimes violent 15-month strike against the AT Massey Coal Co. ended in December, but there was continuing controversy over the wage and benefit terms that would apply to the workers. The strike began in October 1984, when Massey refused to accept the wage and benefit terms the United Mine Workers had negotiated with the Bituminous Coal Operators Association (BCOA), which set the pattern for most of the organized firms. Further complicating the situation, Massey insisted that each of its subsidiaries should bargain separately, while the union insisted that Massey should bargain as an entity. This led the union to complain to the National Labor Relations Board that Massey was refusing to bargain.

The issue was resolved in December 1985, when Massey agreed to bargain with the union as an entity. Immediately afterward, UMW President Richard Trumka ordered the miners to return to work, contending that all Massey facilities were covered by the BCOA terms because two of the subsidiaries had earlier accepted the BCOA terms. However, company President Morgan E. Massey said that any returning miners would have to work under terms "different from the ones contained in the 1984 National Bituminous Coal Wage Agreement." He also said that some strikers would not be reinstated because they had "engaged in strike misconduct or violence" and because some mines had been shut down. Another uncertainty involved the status of replacement workers the company had hired during the stoppage. The UMW contended that they must be terminated under NLRB rules governing strikes over a refusal to bargain.

The final outcome of the dispute could be delayed for some time as the UMW filed suit in Federal District Court in an attempt to force Massey to abide by the BCOA terms. Meanwhile, some strikers were returning to work at the mines, located in West Virginia, Kentucky, and Pennsylvania.

Grocery workers back on job

About 21,000 meat department, warehouse, and delivery employees of seven Southern California grocery chains returned to work in December after their unions settled with the Food Employers Council, the employers' association. The first break in the 2-month work stoppage came when the Teamsters settled for the 11,000 warehouse and delivery employees. The meat department workers, who are represented by the Food and Commercial Workers, rejected the employer's initial offer, then narrowly approved the second offer that included a two-tier pay system that was less onerous for employees than one the employers had earlier proposed. Management contended that two-tier pay systems and other contract changes were necessary to help them compete effectively with lower cost nonunion stores. According to one union member who criticized the two-tier approach, the six UFCW locals in Southern California had lost 50,000 out of 60,000 members over a 6-year period, primarily as a result of new meat processing and packaging methods.

Under the two-tier system, new meat wrappers will start at $5.53 an hour and progress to a maximum of $7.90 as a meat cutter. Current employees, who earn a maximum of $12.16, were not affected.

In another cost reduction change, markets will be required to have a top-rated meat cutter on duty 8 hours a day, instead of the previous 16 hours.

Other terms, which also applied to the Teamsters members, included no wage change in the first contract year, lump-sum payments of up to $500 in September 1986 and up to $1,000 in September 1987, calculated on employee earnings during the preceding 12 months; a 40- to 45-cent wage increase (40 cents for Teamsters members) in September 1987; suspension of the cost-of-living pay adjustment provision; and improvements in pension and insurance benefits, which varied for the two unions.

Amoco and union reach accord

A round of pattern settlements began in the petroleum refining and distribution industry after American Oil Co. and the Oil, Chemical and Atomic Workers negotiated a 2-year contract. The wage and benefit terms were expected to eventually apply to about 46,000 workers covered by 265 contracts with nearly 100 companies. The union's bargaining strength was diminished somewhat by the worldwide oversupply of petroleum, a factor in the loss of 20,000 jobs including about 10,000 covered by OCAW contracts, in the last 5 years. The OCAW also was faced with the problem that walkouts to enforce its demands are not completely effective because the high degree of automation in the industry permits management to maintain more or less normal operation.

The Amoco accord, which covered 4,000 employees, provided for an immediate $1,000 lump-sum payment and a 2-percent wage increase in January 1987, which amounted to 28 cents an hour based on the industry's reported average hourly earnings of $14.16.

Amoco also agreed to increase its financing of health insurance by $7 a month for family coverage and $2 for single coverage in the first year and by $5 and $1.50, respectively, in the second year.

Among the first companies to settle on pattern contracts were Atlantic Richfield Corp. and Chevron Corp.

Machinists settle after strike

In Connecticut, the first strike against the Pratt Whitney Group since 1960 ended when the company and the Machinists union agreed on a 3-year contract. The 2-week stoppage involved operations in Middletown, North Haven, and Southington. Workers at the main plant, in East Hartford, did not participate in the strike but were covered by the wage and benefit terms of the new contract.

The contract provided for two immediate lump-sum payments, one of $300 and the other equal to 3.5 percent of 1985 earnings, or about $700, according to the union. In November 1986, the 15,000 workers will receive another lump-sum payment calculated at 3.5 percent of the prior 12 months' earnings, followed by a 3-percent pay increase in November 1987.

Improvements also were made in the savings plan and in insurance.

Changes were also made in job security provisions, reflecting the union's concern over the reported loss of 8,500 jobs in the past 5 years as a result of technological change and the scheduled elimination of 1,200 jobs during the next 12 months.

One change provides for the company to pay up to 75 percent of the cost of retraining displaced workers. Other changes limit the company's right to farm out work that could be performed by bargaining unit members and require the company to post all available jobs for bidding by qualified workers.

Armstrong contract to improve productivity

In Lancaster, PA, nearly 1,900 employees of Armstrong World Industries Inc. flooring plant were covered by new 1-year agreements. One agreement, for 1,600 production workers, was negotiated by the United Rubber Workers and the other, for machine operators and maintenance employees, was negotiated by the Machinists union.

Wage terms included a 5-percent immediate increase, which reportedly averaged 45 cents an hour for production workers and 60 cents for skilled workers. There also were changes in transfer, seniority, attendance, and other provisions "designed to improve plant productivity," according to a company official.

Safeway employees get new contract

In the Kansas City, MO, area, more than 1,200 employees of Safeway Stores Inc. negotiated a 2-year contract that provided for a $500 lump-sum payment effective immediately and a 4-percent wage increase effective July 13, 1986. The wage increase will bring the base rate for food clerks to $9.68 an hour, partly restoring the $2 an hour wage cut the employees took in their prior settlement.

Insurance improvements for the employees, who are represented by the United Food and Commercial Workers, included addition of "well-baby" coverage, annual payments of up to $100 for physical examinations, and extension of coverage to organ and tissue transplant procedures. □

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force, employment, unemployment, collective bargaining settlements, consumer, producer, and international prices, productivity, international comparisons, and injury and illness statistics. In the notes that follow, the data in each group of tables is briefly described, key definitions are given, notes on the data are set forth, and sources of additional information are cited.

General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as "seasonally adjusted." (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. (Seasonally adjusted data appear in tables 1–3, 4–10, 13, 14, and 18.) Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X–11 ARIMA, which was developed at Statistics Canada as an extension of the standard X–11 method previously used by BLS. A detailed description of the procedure appears in *The X–11 ARIMA Seasonal Adjustment Method* by Estla Bee Dagum (Statistics Canada, Catalogue No. 12–564E, January 1983). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. However, revisions of historical data continue to be made only at the end of each calendar year.

Seasonally adjusted labor force data in tables 1 and 4–10 were revised in the February 1986 issue of the *Review*, to reflect experience through 1985.

Annual revisions of the seasonally adjusted payroll data shown in tables 13, 14, and 18 were made in July 1985 using the X–11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in table 42 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data—such as the Hourly Earnings Index in table 17—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The $2 (or any other resulting values) are described as "real," "constant," or "1967" dollars.

Additional information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule preceding these general notes. More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in *Employment and Earnings*, a monthly publication of the Bureau. More data from the household survey is published in the two-volume data book—*Labor Force Statistics Derived From the Current Population Survey*, Bulletin 2096. More data from the establishment survey appears in two data books—*Employment, Hours, and Earnings, United States*, and *Employment, Hours, and Earnings, States and Areas*, and the annual supplements to these data books. More detailed information on employee compensation and collective bargaining settlements is published in the monthly periodical, *Current Wage Developments*. More detailed data on consumer and producer prices are published in the monthly periodicals, *The CPI Detailed Report*, and *Producer Prices and Price Indexes*. Detailed data on all of the series in this section are provided in the *Handbook of Labor Statistics*, which is published biennally by the Bureau. BLS bulletins are issued covering productivity, injury and illness, and other data in this section. Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

Symbols

p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally, this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.
n.e.s. = not elsewhere specified.

COMPARATIVE INDICATORS
(Tables 1–3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-to-population ratio, and unemployment rates for major demographic groups based on the Current Population ("household") Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonagricultural payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on **changes in compensation, prices, and productivity** are presented in table 2. Measures of rates of change of compensation and wages from the Employment Cost Index program are provided for all civilian

nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in: consumer prices for all urban consumers; producer prices by stage of processing; and the overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data. For detailed descriptions of each data series, see BLS *Handbook of Methods*, Volumes I and II, Bulletins 2134–1 and 2134–2 (Bureau of Labor Statistics, 1982 and 1984, respectively), as well as the additional bulletins, articles, and other publications noted in the separate sections of the *Review*'s "Current Labor Statistics Notes." Historical data for many series are provided in the *Handbook of Labor Statistics, Bulletin 2217* (Bureau of Labor Statistics, 1985). Users may also wish to consult *Major Programs, Bureau of Labor Statistics*, Report 718 (Bureau of Labor Statistics, 1985).

EMPLOYMENT DATA

(Tables 1; 4–21)

Household survey data

Description of the series

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 59,500 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons include (1) all civilians who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. Members of the Armed Forces stationed in the United States are also included in the employed total. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **overall unemployment rate** represents the number unemployed as a percent of the labor force, including the resident Armed Forces. The **civilian unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **labor force** consists of all employed or unemployed civilians plus members of the Armed Forces stationed in the United States. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons who are retired, those engaged in their own housework, those not working while attending school, those unable to work because of long-term illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy, and members of the Armed Forces stationed in the United States. The **labor force participation rate** is the proportion of the noninstitutional population that is in the labor force. The **employment-population ratio** is total employment (including the resident Armed Forces) as a percent of the noninstitutional population.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 4–10 are seasonally adjusted, based on the seasonal experience through December 1984.

Additional sources of information

For detailed explanations of the data, see BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 1, and for additional data, *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985). A detailed description of the Current Population Survey as well as additional data are available in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*. Historical data from 1948 to 1982 are available in *Labor Force Statistics Derived from the Current Population Survey: A Databook*, Vols. I and II, Bulletin 2096 (Bureau of Labor Statistics, 1982).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Establishment survey data

Description of the series

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by more than 200,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday

and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 12–16 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in the following industries: transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. These groups account for about four-fifths of the total employment on private nonagricutural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earner and Clerical Workers (CPI-W). The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index, introduced in the May 1983 *Review*, represents the percent of 185 nonagricultural industries in which employment was rising over the indicated period. One-half of the industries with unchanged employment are counted as rising. In line with Bureau practice, data for the 1-, 3-, and 6-month spans are seasonally adjusted, while those for the 12-month span are unadjusted. The diffusion index is useful for measuring the dispersion of economic gains or losses and is also an economic indicator.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of May 1985 data, published in the July 1985 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Unadjusted data have been revised back to April 1983; seasonally adjusted data have been revised back to January 1980. These revisions were published in the *Supplement to Employment and Earnings* (Bureau of Labor Statistics, 1985). Unadjusted data from April 1984 forward, and seasonally adjusted data from January 1981 forward are subject to revision in future benchmarks.

Additional sources of information

Detailed data from the establishment survey are published monthly in the BLS periodical, *Employment and Earnings*. Earlier comparable unadjusted and seasonally adjusted data are published in *Employment, Hours, and Earnings, United States, 1909–84*, Bulletin 1312–12 (Bureau of Labor Statistics, 1985) and its annual supplement. For a detailed discussion of the methodology of the survey, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 2. For additional data, see *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20.

Unemployment data by State

Description of the series

Data presented in this section are obtained from two major sources—the Current Population Survey (CPS) and the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act and the Public Works and Economic Development Act. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

Notes on the data

Data refer to State of residence. Monthly data for 11 States—California, Florida, Illinois, Massachusetts, Michigan, New York, New Jersey, North Carolina, Ohio, Pennsylvania, and Texas—are obtained directly from the CPS, because the size of the sample is large enough to meet BLS standards of reliability. Data for the remaining 39 States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates for the 11 States are revised to new population controls. For the remaining States and the District of Columbia, data are benchmarked to annual average CPS levels.

Additional sources of information

Information on the concepts, definitions, and technical procedures used to develop labor force data for States and sub-State areas as well as additional data on sub-States are provided in the monthly Bureau of Labor Statistics periodical, *Employment and Earnings*, and the annual report, *Geographic Profile of Employment and Unemployment* (Bureau of Labor Statistics). See also *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 4.

COMPENSATION AND WAGE DATA

(Tables 1–3; 22–29)

COMPENSATION AND WAGE DATA are gathered by the Bureau from business establishments, State and local governments, labor unions, collective bargaining agreements on file with the Bureau, and secondary sources.

Employment Cost Index

Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It uses a fixed market basket of labor—similar in concept to the Consumer Price Index's fixed market basket of goods and services—to measure change over time in employer costs of employing labor. The index is not seasonally adjusted.

Statistical series on total compensation costs and on wages and salaries are available for private nonfarm workers excluding proprietors, the self-employed, and household workers. Both series are also available for State and local government workers and for the civilian nonfarm economy, which consists of private industry and State and local government workers combined. Federal workers are excluded.

The Employment Cost Index probability sample consists of about 2,200 private nonfarm establishments providing about 12,000 occupational observations and 700 State and local government establishments providing

3,500 occupational observations selected to represent total employment in each sector. On average, each reporting unit provides wage and compensation information on five well-specified occupations. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Fixed employment weights from the 1970 Census of Population are used each quarter to calculate the indexes for civilian, private, and State and local governments. These fixed weights, also used to derive all of the industry and occupation series indexes, ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the bargaining status, region, and metropolitan/nonmetropolitan area series, however, employment data by industry and occupation are not available from the census. Instead, the 1970 employment weights are reallocated within these series each quarter based on the current sample. Therefore, these indexes are not strictly comparable to those for the aggregate, industry, and occupation series.

Definitions

Total compensation costs include wages, salaries, and the employer costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as social security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

Notes on the data

The Employment Cost Index data series began in the fourth quarter of 1975, with the quarterly percent change in wages and salaries in the private nonfarm sector. Data on employer costs for employee benefits were included in 1980 to produce, when combined with the wages and salaries series, a measure of the percent change in employer costs for employee total compensation. State and local government units were added to the ECI coverage in 1981, providing a measure of total compensation change in the *civilian* nonfarm economy (excluding Federal employees). Historical indexes (June 1981=100) of the quarterly rates of change are presented in the May issue of the BLS monthly periodical, *Current Wage Developments*.

Additional sources of information

For a more detailed discussion of the Employment Cost Index, see Chapter 11, "The Employment Cost Index," in the *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 11, and the following *Monthly Labor Review* articles: "Employment Cost Index: a measure of change in the 'price of labor'," July 1975; "How benefits will be incorporated into the Employment Cost Index," January 1978; "Estimation procedures for the Employment Cost Index," May 1982; and "Introducing new weights for the Employment Cost Index," June 1985.

Data on the ECI are also available in BLS quarterly press releases issued in the month following the reference months of March, June, September, and December; and from the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

Collective bargaining settlements

Description of the series

Collective bargaining settlements data provide statistical measures of negotiated adjustments (increases, decreases, and freezes) in compensation (wages and benefits costs) and wages alone, quarterly for private industry and semiannually for State and local government. Compensation measures cover all collective bargaining situations involving 5,000 workers or more and wage measures cover all situations involving 1,000 workers or more. These data, covering private nonagricultural industries and State and local governments, are calculated using information obtained from bargaining agreements on file with the Bureau, parties to the agreements, and secondary sources, such as newspaper accounts. The data are not seasonally adjusted.

Settlement data are measured in terms of future specified adjustments: those that will occur within 12 months after contract ratification—first year—and all adjustments that will occur over the life of the contract expressed as an average annual rate. Adjustments are worker weighted. Both first-year and over-the-life measures exclude wage changes that may occur under cost-of-living clauses that are triggered by future movements in the Consumer Price Index.

Effective wage adjustments measure all adjustments occurring in the reference period, regardless of the settlement date. Included are changes from settlements reached during the period, changes deferred from contracts negotiated in earlier periods, and changes under cost-of-living adjustment clauses. Each wage change is worker weighted. The changes are prorated over all workers under agreements during the reference period yielding the average adjustment.

Definitions

Wage rate changes are calculated by dividing newly negotiated wages by the average hourly earnings, excluding overtime, at the time the agreement is reached. Compensation changes are calculated by dividing the change in the value of the newly negotiated wage and benefit package by existing average hourly compensation, which includes the cost of previously negotiated benefits, legally required social insurance programs, and average hourly earnings.

Compensation changes are calculated by placing a value on the benefit portion of the settlements at the time they are reached. The cost estimates are based on the assumption that conditions existing at the time of settlement (for example, methods of financing pensions or composition of labor force) will remain constant. The data, therefore, are measures of negotiated changes and not of total changes in employer cost.

Contract duration runs from the effective date of the agreement to the expiration date or first wage reopening date, if applicable. Average annual percent changes over the contract term take account of the compounding of successive changes.

Notes on the data

Care should be exercised in comparing the size and nature of the settlements in State and local government with those in the private sector because of differences in bargaining practices and settlement characteristics. A principal difference is the incidence of cost-of-living adjustment (COLA) clauses which cover only about 2 percent of workers under a few local government settlements, but cover 50 percent of workers under private sector settlements. Agreements without COLA's tend to provide larger specified wage increases than those with COLA's. Another difference is that State and local government bargaining frequently excludes pension benefits which are often prescribed by law. In the private sector, in contrast, pensions are typically a bargaining issue.

Additional sources of information

For a more detailed discussion on the series, see of the *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 10. Comprehensive data are published in press releases issued quarterly (in January, April, July, and October) for private industry, and semi-

annually (in February and August) for State and local government. Historical data and additional detailed tabulations for the prior calendar year appear in the April issue of the BLS monthly periodical, *Current Wage Developments*.

Work stoppages

Description of the series

Data on **work stoppages** measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of time lost because of stoppage.

Data are largely from newspaper accounts and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate number of work days lost by workers involved in the stoppages.

Days of idleness as a percent of estimated working time: Aggregate work days lost as a percent of the aggregate number of standard work days in the period multiplied by total employment in the period.

Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

Additional sources of information

Data for each calendar year are reported in a BLS press release issued in the first quarter of the following year. Monthly data appear in the BLS monthly periodical, *Current Wage Developments*. Historical data appear in the *BLS Handbook of Labor Statistics*.

Other compensation data

Other BLS data on pay and benefits, not included in the Current Labor Statistics section of the *Monthly Labor Review*, appear in and consist of the following:

Industry Wage Surveys provide data for specific occupations selected to represent an industry's wage structure and the types of activities performed by its workers. The Bureau collects information on weekly work schedules, shift operations and pay differentials, paid holiday and vacation practices, and information on incidence of health, insurance, and retirement plans. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Monthly Labor Review*.

Area Wage Surveys annually provide data for selected office, clerical, professional, technical, maintenance, toolroom, powerplant, material movement, and custodial occupations common to a wide variety of industries in the areas (labor markets) surveyed. Reports are issued throughout the year as the surveys are completed. Summaries of the data and special analyses also appear in the *Review*.

The National Survey of Professional, Administrative, Technical, and Clerical Pay provides detailed information annually on salary levels and distributions for the types of jobs mentioned in the survey's title in private employment. Although the definitions of the jobs surveyed reflect the duties and responsibilities in private industry, they are designed to match specific pay grades of Federal white-collar employees under the General Schedule pay system. Accordingly, this survey provides the legally required information for comparing the pay of salaried employees in the Federal civil service with pay in private industry. (See Federal Pay Comparability Act of 1970, 5 U.S.C. 5305.) Data are published in a BLS news release issued in the summer and in a bulletin each fall; summaries and analytical articles also appear in the *Review*.

Employee Benefits Survey provides nationwide information on the incidence and characteristics of employee benefit plans in medium and large establishments in the United States, excluding Alaska and Hawaii. Data are published in an annual BLS news release and bulletin, as well as in special articles appearing in the *Review*.

PRICE DATA
(Tables 2; 30–41)

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Consumer Price Indexes

Description of the series

The **Consumer Price Index** (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI–W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all urban consumer index (CPI–U) introduced in 1978 is representative of the 1972–73 buying habits of about 80 percent of the noninstitutional population of the United States at that time, compared with 40 percent represented in the CPI–W. In addition to wage earners and clerical workers, the CPI–U covers professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items are kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 24,000 retail establishments and 24,000 tenants in 85 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 28 major urban centers are presented in table 31. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are measured for the CPI–U. A rental equivalence method replaced the

asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes.

Additional sources of information

For a discussion of the general method for computing the CPI, see *BLS Handbook of Methods, Volume II, The Consumer Price Index*, Bulletin 2134–2 (Bureau of Labor Statistics, 1984). The recent change in the measurement of homeownership costs is discussed in Robert Gillingham and Walter Lane, "Changing the treatment of shelter costs for homeowners in the CPI," *Monthly Labor Review*, June 1982, pp. 9–14.

Additional detailed CPI data and regular analyses of consumer price changes are provided in the *CPI Detailed Report*, a monthly publication of the Bureau. Historical data for the overall CPI and for selected groupings may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

Producer price indexes

Description of the series

Producer Price Indexes (PPI) measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 60,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The stage of processing structure of Producer Price Indexes organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1976, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

Notes on the data

Beginning with the January 1986 issue, the *Review* is no longer presenting tables of Producer Price Indexes for commodity groupings, special composite groups, or SIC industries. However, these data will continue to be presented in the Bureau's monthly publication *Producer Price Indexes*. Series on the net output of major mining and manufacturing industry groups will appear in the *Review* starting with data for July 1986.

The Bureau has completed the first major stage of its comprehensive overhaul of the theory, methods, and procedures used to construct the Producer Price Indexes. Changes include the replacement of judgment sampling with probability sampling techniques; expansion to systematic coverage of the net output of virtually all industries in the mining and manufacturing sectors; a shift from a commodity to an industry orientation; the exclusion of imports from, and the inclusion of exports in, the survey universe; and the respecification of commodities priced to conform to Bureau of the Census definitions. These and other changes have been phased in gradually since 1978. The result is a system of indexes that is easier to use in conjunction with data on wages, productivity, and employment and other series that are organized in terms of the Standard Industrial Classification and the Census product class designations.

Additional sources of information

For a discussion of the methodology for computing Producer Price Indexes, see *BLS Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 7.

Additional detailed data and analyses of price changes are provided monthly in *Producer Price Indexes*. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

International price indexes

Description of the series

The BLS **International Price Program** produces quarterly export and import price indexes for nonmilitary goods traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts: it includes corporations, businesses, and individuals but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents. With publication of an all-import index in February 1983 and an all-export index in February 1984, all U.S. merchandise imports and exports now are represented in these indexes. The reference period for the indexes is 1977 = 100, unless otherwise indicated.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected quarterly by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S. border for imports. For nearly all products, the prices refer to transactions completed during the first 2 weeks of the third month of each calendar quarter—March, June, September, and December. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined by the 4- and 5-digit level of detail of the Standard Industrial Trade Classification System (SITC). The calculation of indexes by SITC category facilitates the comparison of U.S. price trends and sector production with similar data for other countries. Detailed indexes are also computed and published on a Standard Industrial Classification (SIC-based) basis, as well as by end-use class.

Notes on the data

The export and import price indexes are weighted indexes of the Laspeyeres type. Price relatives are assigned equal importance within each weight category and are then aggregated to the SITC level. The values assigned to each weight category are based on trade value figures compiled

by the Bureau of the Census. The trade weights currently used to compute both indexes relate to 1980.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's quarterly questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

For the export price indexes, the preferred pricing basis is f.a.s. (free alongside ship) U.S. port of exportation. When firms report export prices f.o.b. (free on board), production point information is collected which enables the Bureau to calculate a shipment cost to the port of exportation.

An attempt is made to collect two prices for imports. The first is the import price f.o.b. at the foreign port of exportation, which is consistent with the basis for valuation of imports in the national accounts. The second is the import price c.i.f. (cost, insurance, and freight) at the U.S. port of importation, which also includes the other costs associated with bringing the product to the U.S. border. It does not, however, include duty charges.

Additional sources of information

For a discussion of the general method of computing International Price Indexes, see BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 8.

Additional detailed data and analyses of international price developments are presented in the Bureau's quarterly publication *U.S. Import and Export Price Indexes* and in occasional *Monthly Labor Review* articles prepared by BLS analysts. Selected historical data may be found in the *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985).

PRODUCTIVITY DATA
(Tables 2; 42–47)

U. S. productivity and related data

Description of the series

The productivity measures relate real physical output to real input. As such, they encompass a family of measures which include single factor input measures, such as output per unit of labor input (output per hour) or output per unit of capital input, as well as measures of multifactor productivity (output per unit of labor and capital inputs combined). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

Definitions

Output per hour of all persons (labor productivity) is the value of goods and services in constant prices produced per hour of labor input. **Output per unit of capital services** (capital productivity) is the value of goods and services in constant dollars produced per unit of capital services input.

Multifactor productivity is the ratio output per unit of labor and capital inputs combined. Changes in this measure reflect changes in a number of factors which affect the production process such as changes in technology, shifts in the composition of the labor force, changes in capacity utilization, research and development, skill and efforts of the work force, management, and so forth. Changes in the output per hour measures reflect the impact of these factors as well as the substitution of capital for labor.

Compensation per hour is the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, and the wages, salaries, and supplementary payments for the self-employed (except for nonfinancial corporations in which there are no self-employed)—the sum divided by hours paid for. **Real compensation per hour** is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs is the labor compensation costs expended in the production of a unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current dollar value of output and dividing by output. **Unit nonlabor costs** contain all the components of unit nonlabor payments *except* unit profits.

Unit profits include corporate profits and the value of inventory adjustments per unit of output.

Hours of all persons are the total hours paid of payroll workers, self-employed persons, and unpaid family workers.

Capital services is the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories—weighted by rental prices for each type of asset.

Labor and capital inputs combined are derived by combining changes in labor and capital inputs with weights which represent each component's share of total output. The indexes for capital services and combined units of labor and capital are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

Notes on the data

Output measures for the business sector and the nonfarm businesss sector exclude the constant dollar value of owner-occupied housing, rest of world, households and institutions, and general government output from the constant dollar value of gross national product. The measures are derived from data supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are developed from data of the Bureau of Labor Statistics and the Bureau of Economic Analysis.

The productivity and associated cost measures in tables 42–44 describe the relationship between output in real terms and the labor time and capital services involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input. Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; capital investment; level of output; utilization of capacity, energy, and materials; the organization of production; managerial skill; and the characteristics and efforts of the work force.

Additional sources of information

Descriptions of methodology underlying the measurement of output per hour and multifactor productivity are found in the BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 13. Historical data for selected industries are provided in the Bureau's *Handbook of Labor Statistics*, 1985, Bulletin 2217.

International comparisons

Description of the series

Comparative measures of labor force, employment, and unemployment (tables 45 and 46) are prepared regularly for the United States, Canada, Australia, Japan, France, Germany, Great Britain, Italy, the Netherlands, and Sweden. Unemployment rates, approximating U.S. concepts, are prepared monthly for most of the countries; the other measures, annually.

The Bureau of Labor Statistics also prepares international comparisons of manufacturing labor productivity and labor costs (table 47) that cover the United States and 11 foreign countries—those listed above plus Belgium and Norway. These measures are limited to trend comparisons; that is, intercountry series of changes over time, rather than level comparisons because reliable international comparisons of the levels of manufacturing are unavailable. The U.S. measures are described in the notes on U.S. productivity measurement; the measures for foreign countries are compiled from various national and international data sources.

Definitions

Output measures are constant value output (value added) from the national accounts of each country, except for those for Japan prior to 1970 and for the Netherlands for 1969 forward, which are indexes of industrial production. The national accounting methods for measuring real output differ considerably among the 12 countries, but the use of different procedures does not, in itself, connote lack of comparability—rather, it reflects differences among countries in the availability and reliability of underlying data series.

Hours and compensation measures refer to all employed persons including the self-employed in the United States and Canada, and to all wage and salary employees in the other countries. *Hours* refer to hours *paid* in the United States, hours *worked* in the other countries. *Compensation (labor costs)* includes not only all payments made directly to employees and employer expenditures for social insurance and private benefit plans, but changes in significant employment or payroll taxes that are not compensation to employees but are labor costs to employers (France, Sweden, and the United Kingdom). Self-employed workers are included in the U.S. and Canadian figures by assuming that their hourly compensation is equal to the average for wage and salary employees.

Notes on the data

The data for the foreign countries in tables 45 and 46 have been adjusted, where necessary, for greater comparability with U.S. definitions of employment and unemployment. The adjusted statistics have been adapted to the age at which compulsory schooling ends in each country. Therefore, the adjusted statistics relate to the civilian population age 16 and over in the United States, France, and Sweden, and from 1973 forward, Great Britain; 15 and over in Canada, Australia, Japan, Germany, and the Netherlands; and 14 and over in Italy. Prior to 1973, the data for Great Britain related to persons age 15 and over. The institutional population is included in the denominator of the labor force participation rates and employment-population ratios for Japan and Germany.

For most of the countries in table 47, the measures refer to total manufacturing as defined by the International Standard Industrial Classification. However, the measures for France (beginning 1959), Italy (beginning 1970), and the United Kingdom (beginning 1976) refer to manufacturing and mining less energy-related products. For all countries, manufacturing includes the activities of government enterprises.

In addition, for all countries, preliminary estimates for recent years are generally based on current indicators of manufacturing output, employment and hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

Additional sources of information

For further information, see *International Comparisons of Unemployment*, Bulletin 1979 (Bureau of Labor Statistics, 1978), Appendix B and Supplements to Appendix B. Additional detail is also found in the BLS *Handbook of Methods*, Bulletin 2134–1, (Bureau of Labor Statistics, 1982), chapter 16. Additional international comparison statistics are available in the *Handbook of Labor Statistics* Bulletin 2217 (Bureau of Labor Statistics, 1985). The most recent statistics are presented and analyzed annually in the *Monthly Labor Review*, typically in the December issue (for the previous year) and in February.

OCCUPATIONAL INJURY AND ILLNESS DATA

(Table 48)

Description of the series

The Annual Survey of Occupational Injuries and Illnesses is designed to collect data on injuries and illnesses based on records which employers in the following industries maintain under the Occupational Safety and Health Act of 1970: agriculture, forestry, and fishing; oil and gas extraction; construction; manufacturing; transportation and public utilities; wholesale and retail trade; finance, insurance, and real estate; and services. Excluded from the survey are self-employed individuals, farmers with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies.

Because the survey is a Federal–State cooperative program and the data must meet the needs of participating State agencies, an independent sample is selected for each State. The sample is selected to represent all private industries in the States and territories. The sample size for the survey is dependent upon (1) the characteristics for which estimates are needed; (2) the industries for which estimates are desired; (3) the characteristics of the population being sampled; (4) the target reliability of the estimates; and (5) the survey design employed.

While there are many characteristics upon which the sample design could be based, the total recorded case incidence rate is used because it is one of the most important characteristics and the least variable; therefore, it requires the smallest sample size.

The survey is based on stratified random sampling with a Neyman allocation and a ratio estimator. The characteristics used to stratify the establishments are the Standard Industrial Classification (SIC) code and size of employment.

Definitions

Recordable occupational injuries and illnesses are: (1) occupational deaths, regardless of the time between injury and death, or the length of the illness; or (2) nonfatal occupational illnesses; or (3) nonfatal occupational injuries which involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment (other than first aid).

Occupational injury is any injury such as a cut, fracture, sprain, amputation, and so forth, which results from a work accident or from exposure involving a single incident in the work environment.

Occupational illness is an abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday cases are cases which involve days away from work, or days of restricted work activity, or both.

Lost workday cases involving restricted work activity are those cases which result in restricted work activity only.

Lost workdays away from work are the number of workdays (consecutive or not) on which the employee would have worked but could not because of occupational injury or illness.

Lost workdays—restricted work activity are the number of workdays (consecutive or not) on which, because of injury or illness: (1) the employee was assigned to another job on a temporary basis; or (2) the employee worked at a permanent job less than full time; or (3) the employee worked at a permanently assigned job but could not perform all duties normally connected with it.

The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked even though able to work.

Incidence rates represent the number of injuries and/or illnesses or lost workdays per 100 full-time workers.

Notes on the data

Estimates are made for industries and employment-size classes and for severity classification: fatalities, lost workday cases, and nonfatal cases without lost workdays. Lost workday cases are separated into those where the employee would have worked but could not and those in which work activity was restricted. Estimates of the number of cases and the number of days lost are made for both categories.

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses, or lost workdays, per 100 full-time employees. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Only a few of the available measures are included in the *Handbook of Labor Statistics*. Full detail is presented in the annual bulletin, *Occupational Injuries and Illnesses in the United States, by Industry*.

Comparable data for individual States are available from the BLS Office of Occupational Safety and Health Statistics.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration, respectively. Data from these organizations are included in BLS and State publications. Federal employee experience is compiled and published by the Occupational Safety and Health Administration. Data on State and local government employees are collected by about half of the States and territories; these data are not compiled nationally.

Additional sources of information

The Supplementary Data System provides detailed information describing various factors associated with work-related injuries and illnesses. These data are obtained from information reported by *employers* to State workers' compensation agencies. The Work Injury Report program examines selected types of accidents through an employee survey which focuses on the circumstances surrounding the injury. These data are not included in the *Handbook of Labor Statistics* but are available from the BLS Office of Occupational Safety and Health Statistics.

The definitions of occupational injuries and illnesses and lost workdays are from *Recordkeeping Requirements under the Occupational Safety and Health Act of 1970*. For additional data, see *Occupational Injuries and Illnesses in the United States, by Industry*, annual Bureau of Labor Statistics bulletin; BLS *Handbook of Methods*, Bulletin 2134–1 (Bureau of Labor Statistics, 1982), chapter 17; *Handbook of Labor Statistics*, Bulletin 2217 (Bureau of Labor Statistics, 1985), pp. 411–14; annual reports in the *Monthly Labor Review*; and annual U.S. Department of Labor press releases.

1. Labor market indicators

Selected indicators	1984	1985	1984				1985			
			I	II	III	IV	I	II	III	IV
Employment data										
Employment status of the civilian noninstitutionalized population (household survey)[1]										
Labor force participation rate	64.4	64.8	64.1	64.5	64.4	64.5	64.8	64.7	64.7	64
